FORWARD

The Enoch City Staff and City Engineer have prepared the following edition of the

ENOCH CITY
ENGINEERING STANDARDS

These standards shall be used for all work located within public streets, rights-of-way, and easements within Enoch City.

Nothing in these standards shall be construed to prohibit the construction of higher type improvements, as approved by the City Engineer.

These Standards meet with the full approval of the Enoch City Staff and City Engineer, dated January 3, 1997.

These Standards were approved by the City Council of Enoch City by Resolution dated June 18, 1997 with revisions approved as follows:

Section 2.6 revised 6-17-98
Section 4.3 revised 6-17-98
Table 4.3 revised 6-17-98
Table 4.3 revised 1-20-99
Table 3.1 revised 9-15-99

SECTION 2
GENERAL IMPROVEMENT REQUIREMENTS

2.1 GENERAL: This section defines the general requirements for public improvements within Enoch City.

The improvements shall include all improvements of a public need, including, but not limited to streets, water, sewer, and drainage. Required improvements shall extend from the nearest acceptable point of existing improvements. Layout must provide for future extension to adjacent properties and shall be compatible with appropriate City master plans. All water lines shall be installed to the boundary lines of the development. Required Geotechnical investigation recommendations shall be followed.

2.2 DEFINITIONS:

2.2.1 CONTRACTOR shall refer to the person or persons actually performing the construction work.

2.2.2 CUSTOMER shall refer to any individual requiring utility services (power, water or sewer).

2.2.3 DEVELOPER shall refer to the contractor, property owner or agent as applicable.

2.2.4 CITY ENGINEER shall refer to the Enoch City Engineer or an authorized representative.

2.2.5 OWNER shall refer to subdividers, developers, or others responsible for constructing improvements or developments on property within Enoch City.

2.2.6 SEWER LATERAL shall refer to any sanitary sewer pipe which runs from the outside of any building to the sewer main line.

2.2.7 SEWER MAIN shall refer to any sanitary sewer line which is eight-inches in diameter or greater.

2.2.8 SEWER OUTFALL LINE shall refer to any sanitary sewer line which carries major sectors of the community or region having trunk lines as its tributaries.

2.3 CONSTRUCTION DRAWINGS: Complete and detailed construction plans and drawings of improvements shall be submitted to the City Engineer. No construction shall be started until plans have been checked and approved by the City Engineer, and other appropriate City officials.
The following instructions are for the purpose of standardizing the preparation of drawings to obtain uniformity in appearance, clarity, size and style:

One set of construction plans shall be submitted to the City Engineer for checking and returned to the Owner/Contractor for correction. When all corrections have been made and the set approved, the approved set shall remain with the City Engineer.

The plans and designs shall meet the standards defined in the Specifications and Drawings hereinafter outlined.

All drawings and/or prints shall be clear and legible and conform to good engineering and professional drafting room practice. Size of drawings shall be 24" by 36".

The developer shall also provide all as-built drawings in Auto Cad format on a 3 1/2" floppy disk with a .dxf or .dwg file format upon completion of the project.

2.3.1 GENERAL: The following shall be included on the drawings:

I. North arrow (plan).

II. Scale and elevations referenced to U.S.G.S. datum.

III. Stationing and elevations for profiles.

IV. Title block, located on the right side of the sheet to include:

A. Project title;

B. Type of project and

C. Professional Engineers stamp (licensed in the State of Utah).

V. Separate sheets for sewer, water, drainage, streets, details and other improvements as required.

2.3.2 STREETS: The drawings for streets shall show:

I. Both plan view and centerline profiles for each street.

II. Flow lines and street centerline elevations at all P.C.s, P.I.s, P.T.s and 100 foot stations.

III. Stationing and all curve data.
IV. Details of drainage system showing flow directions and types of drainage structures.

V. Bench mark locations and elevations (U.S.G.S. datum must be used).

VI. Typical street cross section from right-of-way line to right-of-way line. Showing pavement section.

VII. Gradient (center line of roads, flow-lines of drainage pipes and ditches).

VIII. Location of existing and proposed permanent survey monuments on the approved plans and drawings.

2.3.3 SEWER: Sewer drawings shall show:

I. Location, size, and grade of mains (existing and proposed), and service laterals.

II. Manhole size, station location, top of manhole ring and flow-line elevations.

III. Type of pipe (in accordance with City standards).

IV. Bench mark locations and elevations (U.S.G.S. datum must be used).

V. Typical trench section showing backfill, compaction and shoring requirements.

2.3.4 CULINARY WATER: Culinary water drawings shall show:

I. Size and location of all existing and proposed water mains, valves and hydrants, and service laterals.

II. Type of pipe (only pipe types approved by the City may be used).

III. Minimum cover (36-inches to top of pipe).

IV. Typical trench section showing backfill, compaction and shoring requirements.

2.3.5 DETAIL SHEETS: Each set of plans shall be accompanied by a separate sheet of details for structures which will be constructed. Detail sheets shall include the following information:

I. Drawing size: 24" by 36".

II. Scale of each detail.
III. Title block on the right side of the sheet (same format on all sheets).

IV. Name of the development.

V. All details must be completely dimensioned and described.

VI. All details shall conform to the details shown in the standard drawing section of these standards.

2.4 INSPECTION, TESTING AND QUALITY CONTROL. All construction work involving the installation of improvements in Enoch City shall be subject to City inspection and testing as outlined in the quality control section of each specification.

2.4.1 REQUESTS FOR INSPECTION: Requests for inspections shall be made to the City Engineer or Inspector by the person responsible for the construction. Notice shall be given 24-hours in advance of the starting of work. Any work to be backfilled or covered shall not be backfilled or covered prior to inspection.

2.4.2 CONSTRUCTION COMPLETION INSPECTION. A final inspection shall be made by the City Engineer or a representative upon receipt of a request by the owner after all construction work is completed. Any faulty or defective work shall be corrected by the persons responsible for the work within a period of thirty (30) days from the date of the City Engineer's Inspection Report defining the faulty or defective work.

2.4.3 QUALITY CONTROL TESTING. Material testing shall be conducted by an independent laboratory approved by the City Engineer at the owner's expense. All testing shall comply with current ASTM, AASHTO, AWWA or Public Drinking Water Regulation standards and shall meet the minimum testing requirements as outlined in the specifications. The cost of any and all re-testing required to bring materials into specification shall be borne by the owner or contractor. The time and locations of all tests shall be approved by the City Engineer's office. If determined necessary by the City Engineer or a representative, additional testing can be required.

2.4.4 TEST REPORTS. Written test results will be required for review by the City Engineer after each portion of the work (i.e. pipeline construction, earthwork, drainage structures, and roadway construction).

A final certified report will be required from the developer's testing firm upon completion of the project. This report will include all test results, a summary showing number of tests required, number of tests taken and number of re-tests for each type of test and any other items required in the Uniform Building Code Section 3318.1.
2.5 AS-BUILT DRAWINGS. Before final inspection, the developer shall provide a complete set of as-built drawings that includes all items specified in Section 2.3 Construction Drawings. The as-built drawings shall show all improvement dimensions as they were constructed in the field. The as-built drawings shall be submitted on 24" by 36" mylar sheets and on 3 1/2" floppy disk in AutoCAD .dxf or .dwg format. No bond retainer shall be released until as-built drawings are approved.

2.6 GUARANTEE OF WORK. The owner shall warrant and guarantee that the improvements provided for hereunder, and every part thereof, will remain in good condition for a period of two years after the date of the acceptance of the project by the City or one year after the date of the acceptance of the project by the City, if material testing is complete. The owner shall make all repairs to and maintain the improvements and every part thereof in good condition during the specified time at no cost to the City. (Section 2.6 amended 3-2-2005)

The determination for the necessity of repairs and maintenance of the work shall rest with the City Engineer. Such decisions upon the matter shall be final and binding upon the owner. The guarantee hereby stipulated shall extend to and include, but shall not be limited to, the entire road base, all pipes, joints, valves, manholes, backfill and compaction as well as the working surface, and other accessories that shall be constructed by the owner. Whenever, in the judgement of the City Engineer, said work shall be in need of repairs, maintenance, or rebuilding, written notice shall be served upon the owner and thereupon the owner shall undertake and complete such repairs, maintenance or rebuilding. If the owner fails to do so within thirty days from the date of the service of such notice, the City Engineer shall have such repairs made, and the cost of such repairs shall be paid by the owner together with 25 percent of the cost of the repairs in addition thereto, as stipulated damages for such failure on the part of the developer to make the repairs. Any omission on the part of the Engineer to condemn defective work or materials, at the time of construction, shall not be deemed an acceptance. The contractor and/or owner will be required to correct defective work or materials at any time before final acceptance and within two years thereafter.

2.7 BARRICADES AND WARNING SIGNS. The Contractor shall provide, erect, and maintain all necessary barricades, suitable and sufficient lights, danger signals, signs, and other traffic control devices. All necessary precautions shall be taken to protect the work and to safeguard the public. Streets closed to traffic shall be protected by effective barricades, and obstructions shall be illuminated during hours of darkness. Suitable warning signs shall be provided to control and direct traffic properly. All traffic control operations and signing shall be performed in accordance with the instructions outlined in the "Manual on Uniform Traffic Control Devices", latest edition. A traffic control plan will be required for submittal and approval on each project.

2.8 SURVEY MONUMENTS. Standard City survey control monuments (as shown in the standard drawings of these standards) shall be installed in all streets to be dedicated for public
use. All survey control monuments shall be installed in strategic locations (as determined by the City Engineer) so as to insure adequate survey control required for subsequent resurvey in the area.

2.9 IMPROVEMENT SEQUENCE. City improvements shall be installed in the following sequence, unless otherwise directed by the City Engineer.

1. Rough grading
2. Sanitary Sewer
3. Culinary Water
4. Storm Sewer
5. Electrical Service
6. Natural Gas
7. Telephone
8. Cable T.V.
9. Sub Base
10. Drainage Structures
11. Road Base
12. Asphalt
13. Manholes and Valve Grades
14. Survey Monument
15. Street Signs
16. Clean-up

Contractors and developers shall ensure that all improvement items previous to item #12 (asphalt) are installed before the asphalt. Prior to asphalt installation, developers will provide to the City Engineer a sign-off sheet signed by the electric, telephone, natural gas and cable T.V. utilities verifying their utility or appropriate conduits have been installed. No road breaking permits will be issued on new City streets for 2 years from the date the street was accepted by the City unless there are extenuating circumstances.
SECTION 3

DESIGN STANDARDS

3.1 GENERAL. This section defines design requirements for public improvements within the City of Enoch City. It is not the intent of these standards to restrict professional judgment, but rather to serve as a guide and to establish consistency in design.

3.2 STREET DESIGN. All streets within Enoch City shall be designed structurally to conform to Section 4.3, "Roadway Construction", of these standards. Streets shall conform to City standards for location grades, center line curve radii, right-of-way, pavement, drainage and volumes as shown in Table 3.1.

</tbody>
</table>

Notes for Table 3.1:

(1) Streets shall not have a longitudinal grade of less than 0.5% unless adequate alternative street drainage is provided.

(2) Areas of high water flow may require larger drainage structure capacity than shown.
3.2.1 GEOMETRIC DESIGN. Streets shall be designed to provide adequate stopping and sight distance, degree of curve, and super-elevation in accordance with The American Association of State Highway and Transportation Officials (AASHTO). Vertical curves shall be provided in all changes in grade where the algebraic difference is 1% or greater.

3.2.2 INTERSECTIONS. Street intersection centerline offsets shall be not less than 150 feet. Street intersections shall be as near to 90 degrees as possible ± 5° maximum.

3.2.3 CUL-DE-SACS. Cul-de-sac streets shall not exceed 500 feet in length from center of cross street to center of cul-de-sac, and the turn-around radius (at property line) shall not be less than fifty feet.

3.2.4 STREET ACCESS. The number of access points onto City streets shall be kept to a minimum. The following information shall apply when designing street access for all developments.

I. Direct access will not be allowed for parking, loading or driveway areas that require backing maneuvers onto collector, major collector or arterial streets.

II. Residential and commercial developments will be required to provide at least two improved accesses to the development when the combination of dwelling units and commercial lots exceeds 80. The accesses shall be of proper widths to accommodate the calculated traffic volumes when the area is fully developed. Design volumes for various street widths are shown in Table 3.1. Projected traffic volumes shall be calculated at the rate of 10 vehicles per day per potential dwelling unit.

III. No covered driveways will be allowed unless approved by the City Engineer.

3.2.5 ROAD SIDE MAIL BOXES. Road side mail boxes shall be installed according to the standard drawings.

3.2.6 SIGNS. All signs required for city streets shall be installed by the developer according to the city standards.

3.3 DRAINAGE SYSTEM DESIGN. All subdivisions in Enoch City shall be designed to accommodate rainfall and underground spring runoff in systems separate and independent from the sanitary sewer system. Hydrology studies may be required as part of the design.

3.3.1 SPRING CONTROL. When in the determination of the City Engineer spring control is necessary, the owner shall provide an adequate pipe system to eliminate the nuisance of overland flow.
3.3.2. FLOOD CONTROL. Prior to altering the natural terrain, developers shall consult with the City Engineer to determine the flood control measures necessary in their project area. A flood control system shall be designed and approved as part of the construction plans. Flood water may be conveyed in pipes, major washes, designated floodway easements, or dedicated city streets. Where open ditches or canals exist within or adjoining a subdivision, the owner will be required to pipe the channel and shall coordinate with the irrigation company to accommodate safety or flood control needs. Any canal use or modification will require irrigation company approval.

Design of flood control systems shall meet the following criteria:

I. A flood of 100-year return frequency shall be conveyed within the limits of street right-of-way or easements when used for flood control purposes.

II. All occupied buildings shall be constructed outside floodway limits and above the flood elevation indicated on the FEMA Flood Insurance Rating map.

III. Where an underground pipe system is required, it shall be designed to carry a 10-year return frequency flood or the excess of the 100-year flood that the street cannot contain, whichever is greater. Major hydraulic structures shall be designed to carry a 25-year return frequency.

IV. Streets may be inverted to carry floodwater only with sufficient justification and upon approval of the City Engineer.

V. When designing flood systems, the Engineer shall give proper consideration to adjacent properties. The drainage basin upstream shall be assumed fully developed to conform with the current land use master plan. The impact of said runoff on down-stream properties shall also be considered in the design, including acquisition of easements or agreements when necessary. On site retention may be required.

3.3.3. DRAINAGE DITCHES. Minimum drainage ditch grade shall be 0.50% (0.50 foot elevation difference in 100 feet of road side length).

3.4 SANITARY SEWER DESIGN.

3.4.1 DESIGN FLOWS. All sanitary sewers and appurtenances shall be designed to carry the design flows from all contiguous areas which may, within a reasonable period in the future, be tributary thereto.
Sanitary sewers shall be designed to carry the peak discharge as specified below; also, all sewers shall be designed to transport suspended material so as to preclude the deposition of any solids in the sewer line.

New sewer systems shall be designed on the basis of an average daily per capita flow. Sanitary sewer systems shall be designed to prohibit infiltration and exfiltration. To provide for peak loads, sanitary sewers shall be designed to carry, when 2/3 full, not less than that shown in Table 3.2.

All sewers shall be designed and constructed with hydraulic slopes sufficient to give mean velocities (when flowing 2/3 full) of not less than 2.0 feet per second, based on Manning's formula, using a value for "n" of not less than 0.013. The minimum slopes to be provided shall be as shown in Table 3.3, unless approved otherwise by the City Engineer.

The Engineer must furnish computations for velocities and depth of flow for grades in excess of 10% and for extremely low flow situations. No grades in excess of 15 percent will be allowed.
3.4.2 MINIMUM SIZE AND DEPTH. No public sanitary sewer shall be less than eight inches in diameter. Minimum size of house connections shall be four-inches in diameter. Minimum size of restaurant connections shall be six-inches in diameter. Only one residence, structure, or building shall be served by each lateral connected to the public main. (See Uniform Plumbing Code, Chapter 3)

In general, sanitary sewers shall be designed to a depth of 9 feet to the pipe invert to permit sewer laterals from basements to be connected. Exceptions may be granted in subdivisions or areas in which basement-less houses are to be constructed. In such case a note to that effect shall be made on all plans presented for approval. In no case shall sanitary sewers be designed for a depth of cover less than 36 inches over the top of the sewer pipe. All sewers shall be designed to prevent damage from superimposed loads as well as trench loading conditions.

3.4.3 ALIGNMENT. In general, all sanitary sewers shall be designed for uniform slope and alignment between manholes and shall be laid a distance of at least 10 feet (horizontally) from any existing or proposed water main. In the event that a sewer main cannot be laid at least 10 feet from an existing or proposed water main, then the City Engineer may authorize the implementation of the provisions of section 12.2.1 of the State of Utah Public Drinking Water Regulations.

All Sewer laterals shall intersect the sewer main on the top third of the sewer main pipe as shown in the standard drawings.

3.4.4 SERVICE CONNECTIONS. Service connections to any public sanitary sewer shall be made only to a tee installed at the time of the sewer main installation or by a machine tap and approved saddle compatible with the main line sewer material in accordance with the standard drawings and shall be a minimum of 10 feet, measured horizontally, from any culinary water line or tapping. All connections and service lines must be water tight. All sewer clean-outs shall be made with a standard wye fitting. New subdivisions shall install a sewer lateral per the standard drawings on the main sewer for each proposed lot. The lateral shall be located 10 feet from the low lot line.

No service connection shall be made to any sewer outfall line with a diameter greater than 15 inches. A smaller sewer main will need to be run to the nearest manhole.

All sewer laterals connected to public sewer mains shall conform to table 3.4.

All restaurants, food service establishments and other buildings that use high amounts of grease or oil shall have grease traps approved by the City Pretreatment Coordinator.

</tbody>
</table>

NOTES:

1) Lateral size and slope shall be based on the number of fixture units in the apartment, in accordance with the Uniform Plumbing Code.

2) Under no circumstances shall roof drains, foundation drains, storm drains or sub-drains be connected to the sanitary sewer system.

3.4.5 MANHOLES. Manholes shall be installed at all changes in grade, direction, size or at all intersections; and at distances no greater than 400 feet apart. All manholes shall be accessible to maintenance vehicles, and all sewer easements shall provide at least 12 feet of unobstructed width. Drop manholes shall be provided for a sewer line entering a manhole at an elevation of 18-inches or more above the manhole invert. Floor troughs shall be furnished for all sewers entering manholes, and shall be at least as deep as the full diameter of the sewer main in the manhole.

When a smaller sewer main joins a larger sewer main in a manhole, the pipe flow line elevations shall match.

All manholes shall conform to the detailed dimensions, construction details and materials as shown in the standard drawings. Manholes shall also conform to the conditions as detailed in Section 3, of these standards.

Sewer manholes for all sewer mains of 18 inches or less in diameter shall be a minimum of four feet in inside diameter. For sewer mains larger than 18 inches in diameter or over 12 feet in depth, or for three or more 8" or greater sewer lines that converge, the manholes shall be not less than five feet in inside diameter.
3.4.6 SEWAGE PUMPING STATIONS. The potential for damage or interruption of operation due to flooding shall be considered when locating all sewage pump stations. The stations' structures and electrical and mechanical equipment shall be protected from physical damage by the maximum expected one hundred (100) year flood. The station shall remain fully operational and accessible during the twenty-five (25) year flood.

Sewage pumping stations shall be constructed to meet all of the requirements of the Utah Department of Environmental Quality, Design Requirements for Wastewater Collection, Treatment and Disposal Systems, Utah Administrative Code Section R317-3-3 "Sewage Pumping Stations".

3.5 CULINARY WATER DESIGN. All culinary water mains and appurtenances within Enoch City shall be designed to provide for adequate future service for all contiguous areas which may, within a reasonable period in the future, be tributary thereto.

3.5.1 DESIGN FLOW PRESSURE. Water mains shall be designed to provide a minimum residual pressure of 20 psi under maximum day demand conditions including designed fire flow (as called out in Section 3.5.7 of these Standards). A minimum of 35 psi residual pressure must be maintained under normal peak hour conditions without fire flow.

3.5.2 PEAK INSTANTANEOUS FLOW: Peak instantaneous flow as determined in Section 5.1 of the State of Utah Public Drinking Water Regulations, shall be as follows:

Residential (indoor use -- not including fire flow):

\[ Q_i = 10.8N^{0.64} \]

where:

- \( Q_i \) = Total outdoor flow (in gpm) delivered to all connections.
- \( N \) = Total number of equivalent residential connections.

Peak instantaneous flow shall be assumed for outdoor use as follows:

\[ Q_o = 1.85Q_i \]

where:

- \( Q_o \) = Total flow (in gpm) delivered to all connections.
- \( Q_i \) = \( Q_i \) as defined above.

Peak instantaneous fire flows shall be added to peak instantaneous domestic flows for distribution system design flow total.
Commercial or industrial areas may require special investigation to determine fire flow requirements. Existing and future static pressure and flow information used in the design must be obtained from or approved by the City Water Department Superintendent.

3.5.3 MINIMUM SIZE AND DEPTH. The minimum depth of cover (to the top of the pipe) for water mains shall be three feet below the final grade of the street. Where final grades have not been established, mains shall be installed to a depth great enough to insure three feet of cover below future grade based on the best information available. The water mains shall be sized to deliver the peak instantaneous flow rate as determined in Section 3.5.2. The fire flow requirements and pressures shall be as outlined in Section 3.5.7. The minimum size water mains serving any fire hydrant shall be six-inches in diameter.

3.5.4 VALVES AND HYDRANTS. The water distribution system shall be looped and valves shall generally be spaced such that a break in any one length of main will put no more than one block of main, nor more than two fire hydrants out of service (whichever is less), while maintaining adequate minimum service in the remainder of the water system during repairs, except for major transmission lines, where longer spacing may be allowed. All distribution mains connecting to larger supply mains shall be valved at the connection. All fire hydrant runs shall also be valved at the tee on the main line.

Valves generally shall be located at street intersections in line with an extension of the property line.

3.5.5 PRESSURE REDUCING VALVES: The Enoch City Water Department recommends that in high-water-pressure zones in the City, secondary pressure reducing devices shall be installed by the owner on all water connections to buildings. The locations of the high-water-pressure zones within the City can be located and identified upon request from the Enoch City Water Department.

3.5.6 FIRE HYDRANT SPACING AND LOCATION: Generally, fire hydrants shall be spaced and located as follows:

I. In commercial areas, at each intersection, generally on the same sides of the street.

II. In residential areas, fire hydrant spacing shall be no greater than 500 feet and no house shall be more than 250 feet from a hydrant via a street access to the property being served.

III. In multiple family areas, industrial, business or commercial areas, fire hydrant spacing shall require special investigation to determine the hydrant spacing per Appendix 111-B of the Uniform Fire Code.
IV. Generally, hydrants shall be located in line with extensions of the property line when located mid-block.

V. All fire hydrants to be installed on dedicated easements or public rights-of-way will be owned and maintained by the Enoch City Water Department.

3.5.7 FIRE FLOW REQUIREMENTS: Under maximum day demand conditions, fire flow shall be at least 700 gpm at any one hydrant with a total fire flow of at least 1500 gpm at any combination of two hydrants in the area, and/or must meet the requirements of the Insurance Service Office. The total system design shall be such that fire flows and normal peak instantaneous flow demand (as called out in Section 3.5.2 of these standards) can be met while still maintaining a minimum pressure of 20 psi at all points in the distribution system.

High density residential, commercial or industrial areas shall require special investigation to determine fire flow requirements and hydrant spacing per UFC. Existing and future static pressure and flow information used in the design shall be obtained from or approved by the Enoch City Water Department.

3.5.8 MISCELLANEOUS WATER SYSTEM DESIGN CRITERIA.

I. All public water mains shall be installed in an easement at least 12 feet in unobstructed width or in public rights-of-way with adequate access for maintenance vehicles.

II. Dead-end mains shall be avoided wherever possible and if installed, shall not exceed 500 feet. Hydrants shall be located at the end of dead-end mains for flushing purposes as well as for fire protection. Blow-off valves rather than fire hydrants shall be used for initial line blow-off or blow-out after line repairs have been made. Blow-off valves shall be installed per the standard drawings.

III. Each building shall be served by a separate meter and a separate line which extends 10 feet into each lot, to avoid cutting into utility easements at the time of home construction. In some situations a common tap and service line from the main to a manifold with two meter setters and boxes may be installed to serve two adjacent properties. All lots shall have a minimum of 1" service line from the main to the meter box.

IV. All service line taps on ductile iron pipe shall be machine tapped at the time of the water main installation. All service line taps on C-900 or C-905 PVC pipe shall be equipped with a service saddle at the time of the water main installation. Service lines shall be installed prior to testing and acceptance of the water main.
V. Water mains shall be laid at least 10 feet horizontally from any existing or proposed sewer main. The distance shall be measured edge to edge. If necessary and where approved by the City Engineer, Section 12.2.1 of the State of Utah Public Drinking Water Regulations can be implemented.

VI. When a water main crosses over a sewer main, the water main shall be laid at such an elevation that the bottom of the water main is at least 18 inches above the top of the sewer. When the water main cannot be as high as 18 inches above the sewer, the sewer shall be constructed of material with pressure conduit standards for a distance of 20 feet on either side of the crossing.

VII. All tees, bends, plugs and hydrants shall be provided with reaction blocking, tie rods, and/or joints designed to prevent movement, i.e. "mega lug" or approved equal. Wood blocking of future main extensions are not acceptable. Concrete thrust blocks shall be formed and poured in place and must bear against undisturbed soil, per the thrust block details in the standard drawings.

VIII. Air release-vacuum assemblies and blow-off valves shall be provided on all mains larger than 12 inches where required to prevent damage due to air accumulations.

3.6 OTHER UTILITIES SYSTEMS DESIGN. All other utility systems within Enoch City shall be designed to meet the following specifications:

3.6.1 RESPONSIBILITY. Other necessary utility installations (Gas, Electricity, Phone, T.V.) will be coordinated by the developer.

3.6.2 STREET LIGHTS. All developments shall include street light wiring installed at the owner's expense in accordance with the local power company's specifications.

3.6.3 BURIAL OF LINES. All subdivision and planned unit development utility lines shall be underground. Lines shall be buried at a minimum depth of 36". No other lines shall be buried in any water or sewer trench.

3.6.4 LAYOUT. Utility lines shall be placed within designated utility easements as shown in the standard drawings.

3.6.5 FRONT LOT LINE SYSTEMS. Where front lot lines are used, other utility system construction shall not begin until the completion of water, sewer, drainage but must be complete before installation of street asphalt.

3.6.6 QUALITY CONTROL. All utility trench construction shall conform to the design and testing requirements set forth in Section 3.2 (pipeline construction) of these standards.
SECTION 4
CONSTRUCTION STANDARDS

4.1 EARTHWORK. This section defines the requirements for excavation and backfill for structures; construction requirements for embankments and fills; subgrade preparation for pavements and other surface improvements.

4.1.1 DEFINITIONS:

I. EMBANKMENT shall refer to any raised area of compacted earth to support a roadway, structure, parking lot, etc. The material used for embankment shall be specified, and tests shall be performed to determine the fill material's adequacy for the specific project.

II. FILL shall refer to any material used to fill a depression, and can be any material which can be compacted enough to prevent settlement such as earth, broken-up concrete, old building blocks, crushed stone or material from a riverbank, etc. (Embankment is a type of fill.)

III. BACKFILL shall refer to any earth that has been excavated from a trench or other excavation and then replaced and compacted as specified after the structure has been installed.

IV. SUBGRADE shall refer to the native, prepared original soil or engineered fill under any roadway, fill, embankment, structure, etc.

V. MAXIMUM DRY DENSITY as determined by ASTM D 1557.

4.1.2 MATERIALS. Earthwork materials in City improvements shall conform to the following:

I. EXCAVATION. All structures shall be founded on prepared original soil or engineered fill. All unauthorized excavation below the specified structure subgrade shall be replaced with concrete or untreated base course thoroughly compacted to a minimum of 95% of maximum dry density. Subgrade soil for all concrete structures, regardless of type or location, shall be firm and thoroughly compacted to a minimum of 95% of maximum dry density for granular soils or 90% of maximum dry density for silty/clay soils as classified by AASHTO M-145 soil classification system.

II. COARSE GRAVEL. Coarse gravel or crushed stone may be used for subsoil reinforcement when approved by the City Engineer. Such material shall be applied in six-inch layers, each layer being embedded in the subsoil by thorough
tamping. All excess soil shall be removed to compensate for the displacement of the gravel or crushed stone, and the finished elevation of any subsoil reinforced in this manner shall not be above the specified sub-grade.

III. BACKFILLS. Backfill shall be placed to the lines shown on the approved drawings, or as directed by the City Engineer. After completion of construction below the elevation of the final grades, and prior to backfilling, the excavation shall be cleaned and all forms, trash and debris shall be removed. Backfill material shall consist of approved excavated material or clean borrow sand, gravel or other suitable material, and shall be placed in layers compatible with the equipment and not exceeding twelve inches in compacted thickness. Each layer shall be compacted to a minimum density of 95% of maximum dry density for granular soils or 90% of maximum dry density for silty/clay soils as classified by AASHTO M145 soil classification system.

4.1.3 CONSTRUCTION METHODS. The methods employed in performing the work shall be the responsibility of the developer. The developer shall make such changes in the methods employed as are necessary to install an acceptable finished product. These methods shall include but are not limited to the following:

I. CONSTRUCTION OF EMBANKMENTS. Unsuitable materials that occur in the foundations for embankments shall be removed by clearing, stripping and/or grubbing. Soils used as roadway embankment material shall be approved by a licensed Geotechnical engineer or the City Engineer. All materials in embankments shall be placed, moistened, and compacted as provided in the following paragraphs.

When the embankment exceeds the amount of excavation, sufficient additional material shall be obtained from borrow pits provided by the Contractor. All material proposed to be imported shall be subject to the review and approval of the City Engineer prior to starting of hauling operations. The materials used for embankment construction shall be free from sod, grass, trash, rocks larger than six inches in diameter and all other material unsuitable for construction of embankments. The material shall be a granular material as classified by AASHTO M-145 soil classification system.

Grading of completed embankments and backfills shall bring the surfaces to a smooth, uniform condition with final grades being within 0.1 foot of the design grade. Cut and fill slopes shall be 2 horizontal/1 vertical maximum. Construction of slopes steeper than 2 horizontal/1 vertical or fills in excess of 5 feet shall be approved by the Geotechnical engineer.
II. COMPACCIÓN DE MATERIALES TERRESTRES. La materiales de relleno serán depositados en capas horizontales con una espesor no mayor de doce pulgadas y luego compactados a la densidad especificada en el presente documento. El contenido de humedad durante operaciones de compactación se mantendrá entre el 90% óptimo para suelos granulares y dos a cinco % por encima del óptimo para suelos finos. El contenido de humedad se mantendrá uniforme a través de las capas.

Si el contenido de humedad es mayor que lo especificado para compactación, las operaciones de compactación se demorarán hasta que la materiales se hayan secado hasta el contenido de humedad óptimo. Cuando la materiales se ha condicionado como se especifica en el presente documento, el relleno o embalse se compactará como sigue:

Bajo carriles, drenajes estructurales, y aceras, y extendiendo un pie más allá de la construcción proyectada, el embalse de materiales se compactará a una densidad igual a no menos de 95%. Otras materiales y embalses que no estén listados arriba deben ser compactados a un 90% máximo de densidad seca.

Suelos expuestos en áreas de construcción, debajo de caminos, pavimentos y pavimentos de pavimento se harán de grabar a una profundidad de seis pulgadas, humedecidos y compactados a la densidad especificada. Donde la roca es dura, material cementado o roca se expone, grabado no es necesario.

Fundamentos para estructuras no deben estar parcialmente sobre tierra no perturbada o relleno compactado en tierra cementada o roca.

Fundamentos de tierra no deben permitirse envenenarse durante o después de la construcción.

III. PREPARACIÓN DE SUBGRADES. Los suelos originales bajo carriles, drenajes estructurales, y aceras se grabarán a una profundidad de seis pulgadas antes de las operaciones de compactación. Todas las subbases se compactarán a la densidad equivalente de 95% de la densidad seca máxima para suelos granulares o 90% de la densidad seca máxima para suelos silíceos/materiales de arcilla como se clasifiquen por el Sistema de Clasificación de Suelos AASHTO M-145. Ningún material orgánico, arcilla blanda, material mullido o cualquier material perjudicial se permitirá en la subbase. Subbases se formarán y nivelarán dentro de una tolerancia de 0.10 pies de gradiente de diseño y drenaje se mantendrá en todos los tiempos. Subbases se estabilizarán y compactarán como lo indicado por el Ingeniero de la Ciudad. Cualquier río o fuente subterránea de agua encontrada en la construcción de las calles se hará de disposición de la tierra de acuerdo con las instrucciones del Ingeniero de la Ciudad.

Cuando se requiera demostrar la estabilidad y compactación de la subbase, el contratista deberá hacer de rodar la subbase antes de poner cualquier base de gravilla. La subbase...
shall be proof-rolled with at least one pass coverage with a pneumatic tired roller of at least ten-ton capacity. All proof-rolling shall be accomplished in the presence of the engineer. Ground contact pressure for all tires shall be 85 to 90 psi.

When the proof rolling shows an area to be unstable, it shall be brought to satisfactory stability by additional compaction, reworking, or removal of unsuitable material and replacement with acceptable material.

IV. CONSTRUCTION OF NON-STRUCTURAL FILLS. Fills shall be placed to the lines shown on the drawings and shall be any areas not specifically designated for support of structures or utilities (such as landscape areas, open space areas, etc.). Fill material shall have no specific compaction requirements but shall consist of material that can be compacted to prevent settlement such as rocks, old building blocks, crushed stone, broken-up concrete, boulders, etc. Fill material shall not include deleterious materials such as muck, ash, sod, grass, trash, tree stumps, lumber, dead animals, etc.

4.1.4 QUALITY CONTROL. All earth work shall be performed in accordance with these standards and shall be tested and accepted as follows:

I. TESTING. Minimum testing of earthwork shall be as follows:

Soil Classification - One per material source. The sieve analysis shall be according to ASTM C136, C117.

Soil Proctor - One determination for each significant change in soil type as necessary to provide required compaction testing. Tests shall be ASTM D1557 method A or D (modified proctor).

Earth fill moisture/density determination - One test per 500 cubic yards of fill placed in an embankment. Tests shall be ASTM D1556 or D2922 and D3017.

Subgrade moisture/density determination - One test per 1000 square yards of surface area. Moisture density determinations shall be made in accordance with Section 3 of the City Standards. Tests shall be ASTM D1556 or D2922 and D3017.
II. ACCEPTANCE. Any earthwork determined not to be in compliance with these standards shall be removed and replaced or reworked until compliance is obtained. Any costs for the rework or testing the rework shall be paid for by the developer.

4.1.5 SPECIAL EARTH WORK REQUIREMENTS. In areas of Enoch City where a Geotechnical investigation is required before development, the recommendations of the Geotechnical report shall be followed. The requirements outlined previously in this section are only a minimum.

4.2 PIPELINE CONSTRUCTION: This section covers the requirements for material trenching, placement, backfilling, cleaning and testing of underground pipelines and incorporates the requirements of the AWWA Standards and Manufacturers Recommended Installation Procedures, whichever is more stringent. Backfill shall include filling of all trenches to the original ground surface or final grading elevation as shown on the drawings, or otherwise directed by the appropriate city departments.

4.2.1 MATERIALS. This section specifies acceptable pipe and accessories for public sanitary sewers, underground culverts, storm drains, and water pipe construction within Enoch City. The materials used for pipe and fittings shall be all new and shall conform to the requirements for class, brand, size and material as specified.

1. SEWER PIPE: Only those pipes listed below may be used in the construction of sanitary sewer lines in Enoch City.

A. P.V.C. PLASTIC SEWER PIPE: This Specification covers rigid polyvinyl chloride pipe and fittings, hereinafter called PVC fittings. PVC pipe and fittings from 4 inches to 15 inches in diameter shall meet or exceed all of the requirements of ASTM Specification D 3034 with a minimum wall thickness to diameter ratio of SDR-35. PVC pipe and fittings from 18 inches to 27 inches in diameter shall meet or exceed the requirements of ASTM F 679.

Each pipe used shall have a manufacturer's stamp on it indicating that it complies with the requirements of the appropriate specification. Any pipe not so stamped shall be rejected.

All pipe shall be homogeneous throughout and free from cracks, holes, foreign inclusions or other defects. All PVC sewer pipe shall be made from clean, virgin, Type 1, Grade 1, Polyvinyl Chloride conforming to ASTM Resin Specification D 1784.
All pipe joints shall be bell and spigot type with rubber ring gasket to permit expansion and contraction. Pipe and fittings shall be assembled with a non-toxic lubricant. Pipes of 4-inch and 6-inch diameter may be the solvent weld type. Pipe shall have the following minimum SDR-35 dimensions:

<table>
<thead>
<tr>
<th>NOMINAL PIPE SIZE (INCHES)</th>
<th>OUTSIDE DIAMETER (INCHES)</th>
<th>MINIMUM WALL THICKNESS (INCHES)</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>4.215</td>
<td>0.125</td>
</tr>
<tr>
<td>6</td>
<td>6.275</td>
<td>0.180</td>
</tr>
<tr>
<td>8</td>
<td>8.400</td>
<td>0.240</td>
</tr>
<tr>
<td>10</td>
<td>10.500</td>
<td>0.300</td>
</tr>
<tr>
<td>12</td>
<td>12.500</td>
<td>0.360</td>
</tr>
</tbody>
</table>

Spigot ends shall have a 15-degree tapered end with a memory mark around the diameter of the pipe to indicate proper insertion depth. Wyes shall be of the same material as the pipe, and in no case shall have thinner walls than that of the pipe furnished.

B. A.B.S. COMPOSITE AND SOLID WALL SEWER PIPE: This specification covers Acrylonitrile-Butadiene-Sturine (ABS) gravity sewer pipe. All ABS composite sewer pipe shall conform to the latest revision of ASTM Specification D 2680. The ABS material used shall be a virgin rigid plastic conforming to ASTM Specification D 1788 for rigid ABS plastics. The other component shall be Portland Cement, Perlite concrete or other inert filler material exhibiting the same degree of performance.

All solid wall ABS pipe shall conform to ASTM Specifications D 2751. Solid wall pipe used for laterals shall have a minimum wall thickness to diameter ratio of SDR-35. Fittings not described by these standards shall be shop fabricated or molded from materials listed in Paragraphs 4 and 5 of ASTM D 2680 and shall be of equivalent quality to those described.

All field joints shall be chemically welded. Primer, then cement, shall be applied liberally to the outside of the spigot end and the inside of the coupling immediately prior to stabbing the pipe together. The pipe spigot end shall be supplied with home marks to assure proper jointing.

C. RIBBED PVC PIPE: Ribbed PVC sewer pipe (Ultra Rib by Upon or ETI or equal) may be used on all sanitary sewers and storm drains greater than 12-inch diameter when approved by the City Engineer. All ribbed pipe shall be seamless open profile and meet the requirements of ASTM
F794 and Uni-Bell Uni-B-0. Pipe shall have a smooth interior with a solid cross-sectional rib exterior. Exterior ribs shall be perpendicular to the axis of the pipe to allow placement of the sealing gasket without additional cutting or machining. The pipe stiffness shall be a minimum of 46 psi when tested at 5% deflection in accordance with D2412. Pipe shall be green or white in color. The filler material used in the pipe (calcium carbonate) shall not exceed 10% by volume.

II. STORM DRAIN PIPES: All pipes listed under section 4.2.1.I "Sewer Pipes" of these standards as well as the following pipes may be used in the construction of storm drain lines and culverts in Enoch City.

A. NON-REINFORCED CONCRETE PIPE: Non-reinforced concrete sewer pipe may be used for storm drains up to and including 18-inch size unless otherwise specifically designated in these Standards or on the approved Drawings. Pipe shall be extra strength pipe manufactured to comply with the requirements as set forth in ASTM Designation C 14, Class 3 unless otherwise approved by the City Engineer. Joints shall be of the bell and spigot with rubber gasket design, and with joints and gaskets conforming to the requirements of ASTM Designation C 443. Pipe joints shall be so designed as to provide for self-centering, and when assembled, to compress the gasket to form a water-tight seal. The gasket shall be confined in a groove on the spigot so that pipe movement or hydrostatic pressure will not displace the gasket.

B. REINFORCED CONCRETE PIPE: Reinforced Concrete Pipe shall be used for all storm drains greater than 18 inches in diameter, and for all drains of smaller size where installation does not provide a cover of at least 3 feet over the top of the pipe. Reinforced concrete pipe shall comply with the requirements of ASTM C 76 (Class II) unless otherwise approved by the City Engineer. Joints shall be of the bell and spigot design with rubber gasket type joints for storm drains, with an alternate option of tongue and groove mortar joints for storm drain lines when approved by the City Engineer.

C. CORRUGATED POLYETHYLENE PIPE: Corrugated Polyethylene pipe shall be high density polyethylene corrugated exterior/smooth interior pipe. 12 to 36-inch diameters shall conform to AASHTO M 294 Type S; 8 to 10-inch diameter shall meet the strength requirements of AASHTO M252 with the addition that the pipe have a smooth interior liner. Materials shall conform to ASTM D 3350. All pipe joints and fittings shall be water tight to 5 psi according to ASTM D3212 and conform to AASHTO M353 or M294, and shall be approved by the City Engineer.
III. SEWER MANHOLES: This section covers the requirements for the materials used in sanitary sewer and storm water manholes. Manholes shall be water tight and be furnished complete with cast iron rings and covers as follows:

A. CONCRETE BASES: Manhole bases shall be pre-cast or cast-in-place. The concrete shall conform to the requirements of Section 4.4 of these Standards.

Where sewer lines pass through or enter manholes, the invert channels shall be smooth and semi-circular in cross section. Changes of direction of flow within the manholes shall be made with a smooth curve with the longest radius possible. The depth of the channel in the manhole base shall be the full diameter of the sewer pipe being used at that manhole. The floor of the manhole outside the flow channels shall be smooth and slope toward the channel at not less than one-half inch per foot nor more than one-inch per foot.

B. WALL AND CONE SECTIONS: All manholes shall be constructed of either 48-inch or 60-inch inside diameter pre-cast, sectional, reinforced concrete pipe. Both cylindrical and taper sections shall conform to all requirements of ASTM Designation C 76 for Reinforced Concrete Culvert Pipe and shall have ladders according to the standard drawings.

Throat sections of manholes shall be adjustable by use of appropriate diameter pipe sections up to 18 inches in height.

The taper section shall be a maximum of 3 feet in height, shall be of eccentric conical design, and shall taper uniformly from 48 or 60 inches to 30 inches inside diameter. Cones shall be set on the manhole sections so that the top opening of the cone is centered over the center line of the sewer.

Sixty-inch inside diameter sewer manholes shall be required for all sewers greater than 18 inches in diameter or deeper than 12 feet, or where 3 or more 8-inch or greater lines converge in the manhole.

The base section of the manhole shall be furnished in section lengths of 1, 2, 3, and 4 feet as required.

Reinforcing steel shall consist of a circular cage with a minimum cross sectional area of three-tenths of a square inch of steel per foot in both directions.
All joint surfaces of pre-cast sections and the face of the manhole base shall be thoroughly cleaned prior to setting the sections. Joints shall be sealed with a one-inch flexible joint sealant which shall conform to the requirements of ASTM C 923.

C. WATER-TIGHTNESS. Water-tight concrete shall be required in all concrete manholes. Any cracks or imperfections developing at any point in the work shall be satisfactorily repaired. Materials and methods used shall be subject to approval of the City Engineer.

D. IRON CASTINGS. All iron castings shall conform to the requirements of ASTM A 48 (Class 30) for grey iron castings. Frames and covers shall have a minimum combined weight of 402 pounds.

The cover and ring seat shall be machined so that the entire area of the seat will be in contact with the cover, in any position of the cover on the seat. Frames and covers shall be so constructed and machined that the parts are interchangeable. The tops of the cover and frames shall be flush, and the clearance between the frame and cover shall be 1/8 of an inch all around. The top surface of each cover shall be cast with a ribless cross hatch design including the word "Sewer". Letters and design shall be recessed 1/4". Each cover shall be provided with not less than twelve ventilating holes of 3/4-inch diameter each.

All manhole frames shall be carefully set to the finished grade or as directed by the City Engineer. Manhole frames shall be set in place on the manhole throat and shall be sealed with an approved flexible joint sealant which shall conform to the requirements of ASTM C 923. Frames or covers loosened from the manhole throat shall be reset and any frames, covers or throat sections damaged or broken shall be replaced prior to acceptance by the City.

E. MANHOLE STEPS. Manhole steps shall be constructed in accordance with the drawing "Manhole for Sanitary & Storm Sewer" as shown in the standard drawings of these standards and shall be similar in construction to the manhole step as manufactured by M.A. Industries, Inc., of Peachtree City, Georgia.

The steps shall be constructed of number four (one-half-inch diameter) grade 60 reinforcing steel bars bent and embedded in Copolymer Polypropylene Plastic.
The Copolymer Polypropylene Plastic, used to embed the reinforcing bars in, shall conform to the requirements of ASTM 214, Type II grade 43758, and the reinforcing bar shall conform to the requirements of ASTM A 615.

Manhole steps shall be installed at intervals not to exceed 16 inches between steps, be firmly cast into the concrete wall and taper sections of all manholes to a minimum depth of 3-3/8 inches, as shown in the drawings, and form a solidly anchored step which will not pull out or break under repeated use.

IV. WATER PIPE AND FITTINGS. The materials used for pipe and fittings shall be all new and shall conform to the requirements for class, brand, size and material as specified.

A copy of the manufacturer's installation recommendation for each kind of pipe shall be provided to each foreman prior to construction. These recommendations shall be followed during construction unless instructed otherwise by the City Inspector or Engineer. All pipe materials are as follows:

A. GENERAL PIPE REQUIREMENTS: Pipe materials shall conform to the following:

<table>
<thead>
<tr>
<th>SIZE</th>
<th>TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/2&quot; - 3&quot;</td>
<td>Polyethylene (PE) Pressure Pipe</td>
</tr>
<tr>
<td></td>
<td>AWWA C-901 Polyvinyl Chloride (PVC) Rigid Plastic Pipe</td>
</tr>
<tr>
<td></td>
<td>ASTM D-1785</td>
</tr>
<tr>
<td>4&quot; - 12&quot;</td>
<td>Polyvinyl Chloride (PVC) Pressure Pipe AWWA C-900</td>
</tr>
<tr>
<td>Over 12&quot;</td>
<td>Polyvinyl Chloride (PVC) Pressure Pipe AWWA C-905</td>
</tr>
<tr>
<td>Over 3&quot;</td>
<td>Ductile Iron Class 50 AWWA C151</td>
</tr>
</tbody>
</table>

B. CONNECTION WATER METERS: Only authorized employees of the City Water Department shall be allowed to connect or disconnect water meters. All boxes set in concrete shall be flanged to prevent settlement.

NOTE: Where these Standards refer to AWWA Standards, a copy of these standards is available for review at the Enoch City Water Department or at the Enoch City Engineers Office.
C. POLYETHYLENE (PE) PRESSURE PIPE 1/2"-3": All Polyethylene (PE) Pressure Pipe shall be Pressure Class 200, SIDR 7 conforming to the latest edition of AWWA Specification C-901. Unless otherwise specified, all PE pipe furnished under these specifications shall be constructed of ASTM PE3408 Materials. The maximum allowable variation to the standard pipe thickness shall not be more than those shown in Table 4.1a:

**TABLE 4.1a**

POLYETHYLENE PIPE TOLERANCES

<table>
<thead>
<tr>
<th>NOMINAL PIPE SIZE (Inches)</th>
<th>POSITIVE TOLERANCE (Inches)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/2&quot;-1&quot;</td>

<tr>
<td>2 1/2&quot;</td>
<td>0.042</td>
</tr>
<tr>
<td>3&quot;</td>
<td>0.053</td>
</tr>
</tbody>
</table>

D. POLYVINYL CHLORIDE (PVC) RIGID PLASTIC PIPE 1/2"-3": All Polyvinyl Chloride (PVC) Rigid Plastic Pipe, when required, shall be Schedule 40 conforming to the latest edition of ASTM D-1785. Unless otherwise specified, all PVC pipe furnished under these specifications shall be constructed in accordance with ASTM D-1784. The maximum allowable variation to the standard pipe thickness shall not be more than those shown in Table 4.1b:

**TABLE 4.1b**

POLYVINYL CHLORIDE PIPE TOLERANCES

<table>
<thead>
<tr>
<th>NOMINAL PIPE SIZE (Inches)</th>
<th>POSITIVE TOLERANCE (Inches)</th>

<tr>
<td>3&quot;</td>
<td>0.026</td>
</tr>
</tbody>
</table>

E. POLYVINYL CHLORIDE (PVC) PRESSURE PIPE 4"-12": All Polyvinyl Chloride (PVC) Pressure Pipe shall be Pressure Class 200, DR-14, conforming to the latest edition of AWWA Specification C-900. Unless otherwise specified, all PVC pipe furnished under these specifications shall be constructed in accordance with ASTM D-1784. The maximum allowable
variation to the standard pipe thickness shall not be more than those shown in Table 4.1c:

<table>
<thead>
<tr>
<th>NOMINAL PIPE SIZE (Inches)</th>
<th>POSITIVE TOLERANCE (Inches)</th>
</tr>
</thead>
<tbody>
<tr>

<td>0.095</td>
</tr>
<tr>
<td>12&quot;</td>
<td>0.113</td>
</tr>
</tbody>
</table>

F. POLYVINYL CHLORIDE (PVC) PRESSURE PIPE OVER 12": All Polyvinyl Chloride (PVC) Pressure Pipe shall be DR-25, conforming to the latest edition of AWWA Specification C-905. Unless otherwise specified, all PVC pipe furnished under these specifications shall be constructed in accordance with ASTM D-1784. The maximum allowable variation to the standard pipe thickness shall not be more than those shown in Table 4.1d:

<table>
<thead>
<tr>
<th>NOMINAL PIPE SIZE (Inches)</th>
<th>POSITIVE TOLERANCE (Inches)</th>

<td>0.154</td>
</tr>
<tr>
<td>36&quot;</td>
<td>0.184</td>
</tr>
</tbody>
</table>

1. Compliance with "National Sanitation Foundation Standard No. 14 for Thermoplastic Materials" is required on all piping materials and the NSF seal of approval shall appear on the pipe.

2. Pipe joints shall be elastomeric gasketed joints, providing a water tight seal.
3. All fittings used on rigid PVC pipe shall be Class 125 grey or ductile iron and conform with AWWA Specification C110.

4. Couplings used on rigid PVC pipe shall be solid sleeve or transition type with mechanical joints complying with AWWA Specification C110.

G. DUCTILE IRON PIPE: All ductile iron pipe, when required, shall be Class 50 conforming to the latest edition of AWWA Specifications C-151. Pipe and accessories shall be gauged at sufficiently frequent intervals to insure that dimensions are in accordance with Table 51.3 and 51.4 of AWWA Specifications C-151 for the gauge in accordance with the Standard Dimensions. The inside diameters of the sockets and the outside diameters of the spigot ends shall be tested with circular gauges.

Unless otherwise specified, all Ductile Iron Pipe furnished under these Standards shall be designed in accordance with AWWA Specification C-150-76 "American National Standard for the Thickness Design of Ductile Iron Pipe." The maximum allowable variation with the standard pipe thickness shall not be more than those shown in Table 4.1e and note:

<table>
<thead>
<tr>
<th>PIPE DIAMETER (INCHES)</th>
<th>MINUS TOLERANCE (INCHES)</th>

<tr>
<td>48</td>
<td>0.08</td>
</tr>
</tbody>
</table>

Note: An additional tolerance of 0.02 inches shall be permitted over areas not exceeding 8 inches in length.

1. PHYSICAL AND MECHANICAL PROPERTIES: The Ductile Cast Iron Pipe shall conform with all requirements of the ANSI Specification A21.51. The physical properties shall not be less than 60-42-10.

Each pipe shall be subjected to a hydrostatic test of not less than 500 psi. The test may be made either before or after the standard outside coating and bituminous inside coating have been applied, but shall be made before the application of a cement lining or of a special lining.

4-13
The pipe shall be under the full test pressure for at least ten seconds. Any pipe that leaks shall be rejected.

2. **MARKING**: Each pipe shall be legibly marked "Ductile". The weight, a manufacturer's mark, and the year in which the pipe was produced shall be cast or marked on the pipe.

3. **INSPECTION**: The manufacturer shall establish the necessary quality control and inspection practice to assure compliance with these standards. The manufacturer shall, if required by the City Engineer, furnish a certified statement that the inspection and all the specified tests have been made and the results thereof comply with the requirements of these standards. When the City Engineer desires to inspect the pipe at the manufacturer's plant, the City Engineer will so specify and state the extent of the inspection. The City's inspector shall have free access to those parts of the manufacturer's plant which are necessary to assure compliance with these standards. The manufacturer shall provide the inspector with assistance to handle pipe as may be necessary.

4. **REJECTION OF PIPE**: At least one tensile and one impact sample shall be taken during each casting period of approximately three hours. Samples shall be selected to properly represent extremes of pipe diameters and thicknesses. If the results of any physical acceptance test fails to meet the requirements of these standards, all pipe cast in the same sampling period shall be rejected. The manufacturer may determine the extent of rejections by making similar additional tests of pipe until the rejected lot is bracketed (in order of manufacturer) by an acceptable test at each end of the period of question. When pipe of one size is rejected from a sampling period, the acceptability of pipe of different sizes from the same period may be established by making the routine acceptance test for these sizes.

5. **JOINTS**: Ductile Iron Pipe shall be either Mechanical Joints, Rubber Gasket Slip-on Joints, Flanged Joints, or a combination of the above as specified on the plans.

   a. **MECHANICAL JOINTS**: Mechanical joints and the rubber gaskets and lubricant for Ductile Iron Pipe shall comply with the requirements and be dimensioned in accordance with the latest edition of AWWA specifications C-104, C-110 and C-111.
Bolts and rubber gaskets shall be furnished with mechanical joint pipe in sufficient quantity for the amount of pipe ordered.

b. RUBBER GASKET SLIP-ON JOINT. Rubber gasket slip-on joints, and the rubber gaskets and lubricant for Ductile Iron Pipe shall comply with the general requirements of AWWA C-151 and C-111.

Rubber gasket slip-on joints shall be designed for assembly by pre-positioning of a single continuous molded rubber ring gasket in an annular recess in the pipe socket to form a positive seal. The plain end of the pipe shall be suitably beveled to facilitate assembly.

The design and shape of the gasket, and the annular recess therefore, shall be such that the gasket is locked in place against displacement as the joint is assembled. The gasket shall provide adequate compressive force between the plain pipe end and the socket after assembly to effect a positive seal under all combinations of joint and gasket tolerances.

Details of the joint and rubber ring gasket design and assembly shall be in accordance with the pipe manufacturer's standard practice. The pipe supplier shall furnish the City Engineer detailed drawings in quadruplicate showing the design of the joint prior to casting said pipe. The design of the joint shall be subject to the approval of the City Engineer.

The recess in the pipe socket for the rubber ring shall be free of all coating materials and sand pits.

Rubber gaskets and lubricant shall be furnished with rubber gasket joint pipe in sufficient quantity for the amount of pipe ordered.

c. FLANGED JOINTS. Cast iron pipe flanges, and bolts and nuts therefore, shall be dimensioned in accordance with ANSI B-16.2 for Class 200. Threads for screw-on flange pipe shall comply with ANSI B-21. Flange bolts, nuts and gaskets shall be furnished with flange joint pipe in sufficient quantity to make each joint for the pipe ordered. Flanged fittings and spools shall conform to AWWA C-104, C-110 and C-115.
6. LINING AND COATING: The waterway surfaces of all Ductile Iron water pipe and fittings shall be completely covered with a uniform thickness of cement-mortar which shall be further covered with a bituminous seal coat, all in accordance with AWWA C-104. The bituminous seal coat may be omitted if the cement lining is given a 7-day water cure during which the lining is kept consistently damp.

Ductile Iron Pipe or Fittings lined in the field will not be accepted as conforming to AWWA C-104.

The outside surface of all Ductile Iron Pipe for general use under all normal conditions shall have a bituminous coating of coal tar primer approximately 1 mil thick, unless otherwise specified. The finished coating shall be continuous and smooth. It shall be neither brittle when cold, not sticky when exposed to the sun, and shall strongly adhere to the pipe.

7. POLYETHYLENE WRAPPING: A polyethylene wrap will be required on all ductile iron pipe laid in corrosive soils or where directed by the City Engineer. The polyethylene wrap tubing shall be cut to provide for a minimum of one foot of lap over both the adjoining pipes. The ends of the tubing shall be wrapped using three circumferential turns of plastic adhesive tape. The loose wrap on the barrel shall be pulled snugly around the barrel of the pipe and the excess folded over at the top. This fold shall be held in place by means of six-inch strips of plastic tape placed at intervals of three feet along the pipe barrel.

Bends, reducers, and offsets shall be wrapped in the same manner as the pipe. Valves shall be wrapped by bringing the tube wrap on the adjacent pipe over the bells of the valve and sealing with adhesive tape. The valve bodies shall then be wrapped with flat sheets passed under the valve bottom and brought up around the body to the stem and fastened with the tape.

H. COPPER PIPE: Copper Pipe may be used for service lines that are two-inch or less in diameter, type K copper pipe shall be used. Pipe which has outside dimensions greater than two-inch in diameter shall not be copper. All copper pipe shall conform to the following specifications:

1. MATERIAL: Pipe shall be used which conforms to the requirements of ASTM B88. The pipe shall be of a Type K only and
shall be dimensioned so as to allow the connection to AWWA standard water service taps and fittings. The pipe shall have surfaces smooth and free from bumps and irregularities.

2. SERVICE CONNECTIONS: The installation of service connections shall use only connections, equipment and practices recommended by the manufacturer. The service connection shall conform to the detail drawing shown in the standard drawings.

I. FITTINGS: Fittings shall be K-Copper or Cast Iron and of a pressure rating as may be required by the static pressure along the pipeline. All fittings shall be dimensioned according to ANSI A-21.10 (AWWA C 110) "American Standard for Cast Iron Fittings, 3 inches through 48 inches, for Water and other Liquids", and shall be equipped with restraining joints (mega-lug or equal).

J. TAPPING MATERIAL SPECIFICATION: For small tappings (3/4" through 2") tapped into cast iron, steel or ductile iron pipe, the following materials shall be required:

1. SADDLE CASTINGS: Large saddle tappings shall be similar to "Romac Stainless Steel Saddles" constructed of high tensile ductile (modular) iron, in accordance with ASTM specification 536-71, and shall be covered by a black nylon fused coat, approximately 10-12 mils thick, with an approximate dielectric strength of 1000 volts per mill.

2. STAINLESS STEEL STRAP: The stainless steel strap shall consist of a two-inch wide strap to spread out the clamping force on the pipe and shall come complete with sufficient bolts, nuts and washers (with five-eighths-inch N.C. Teflon coated roll threads) to properly clamp the strap to the pipe. M.I.G. welds shall be pasivated for resistance to corrosion.

3. GASKETS: Gaskets shall be made from virgin SBR compounded for water services.

K. VALVES AND BOXES: All valves, 12-inches and smaller shall be of a resilient-seat-gate-valve type, and all valves over 12-inches shall be butterfly valves unless otherwise specified by the City Water Department.

1. GATE VALVES: Valves shall conform to the latest revision of AWWA Resilient Seated gate valve Standard C-509 and be UL listed,
FM approved. All internal parts shall be accessible without removing the body from the line. The wedge shall be of cast iron completely encapsulated with resilient material. The resilient sealing material shall be permanently bonded to the cast iron wedge with a rubber tearing bond to meet ASTM D 429. NRS stems shall be cast bronze with internal collars in compliance with AWWA. OS&Y stems shall be bronze. The NRS stuffing box shall have two "O"-Ring seals above the thrust collar. These rings shall be field replaceable without removing the valve from service.

There shall be low friction thrust bearings above and below the stem collar. The stem nut shall be independent of the wedge and of solid bronze. The waterway in the seat area shall be smooth, unobstructed and free of cavities. Stuffing box shall be attached to the bonnet and the bonnet to the body with bolts and nuts. Blind bolts threaded directly into the body or bonnet will not be acceptable. The body and bonnet shall be coated interior and exterior with corrosion resistant coating. Each valve shall be hydrostatically tested at 400 PSI to the requirements of both AWWA and UL/FM.

Valves shall be installed vertically in a horizontal run of pipe, and shall be provided with a two-inch square operating nut for manually operating the valve with a "T" handle wrench. The direction of rotation to open shall be to the left (counter-clockwise).

2. **BUTTERFLY VALVES**: All butterfly valves shall be of the tight-closing, rubber-seat type with rubber seats that are securely fastened to the valve body. No metal-to-metal seating surfaces shall be permitted. Valves shall be bubble-tight at rated pressures with flow in either direction, and shall be satisfactory for applications involving valve operation after a long period of inactivity. Valve discs shall rotate 90 degrees from the full open position to the tight shut position. Valves twenty inches and smaller shall meet the full requirements of AWWA Standard C504 for Class 150B. The manufacturer shall have manufactured tight-closing, rubber-seat butterfly valves for a period of at least five years. All valves shall be similar to those as manufactured by the Henry Pratt Company or approved equal.

Valve bodies shall be constructed of cast iron ASTM A-126 Class B (for flanged end valves) or ASTM A-48 Class 40 for safer type valves. Flange drilling shall be in accordance with ANSI B16.1 Standard for cast iron flanges. Two trunnions for shaft bearings shall
be integral with each valve body. Body thickness shall be in strict accordance with AWWA Standard C504.

Valve discs shall be constructed of alloy cast iron ASTM A436 Type I (Ni-Resist).

Shafts of all valves shall be turned, ground and polished. Valve shafts shall be constructed of 18-8 Type 304 or Type 316 stainless steel. Shaft diameters shall meet minimum requirements established by AWWA Standard 75 lbs. pull under test procedure ASTM D-429, Method B.

Valves shall be fitted with sleeve-type bearings. Bearings shall be corrosion resistant and self-lubricating. Bearing load shall not exceed one-fifth of the compressive strength of the bearing of shaft material. Packing shall be self-adjusting Chevron type. Valve operators shall conform to AWWA C504.

Manual operators shall be of the traveling nut, self-locking type and shall be designed to hold the valve in any intermediate position between fully open and fully closed without creeping or fluttering. Operators shall be equipped with mechanical stop-limiting devices to prevent over-travel of the disc in the open and closed positions. Valves shall close with a (clockwise) rotation. Operators shall be fully enclosed and designed to produce the specified torque with a maximum pull of 80 lbs. on the handwheel or chain-wheel. Operator components shall withstand an input of 450 Ft. Lbs. at extreme operator position without damage.

3. VALVE BOXES: All valves shall be provided with a Cast Iron valve box of the extension sleeve type, and the correct adjustable height to bring the top of the valve box flush with the ground surface. The valve box shall not be less than five inches in diameter and shall have a minimum thickness of .375 inch. The box provided also shall be provided with a suitable base and cover. The word "WATER" shall be cast on the cover.

L. WATER SERVICE LATERALS: The material used for water service connections shall comply with the following:

1. SERVICE PIPE: Copper or PE pipe and shall be seamless and suitable for use for underground service connections and shall conform to Section 4.2.1.IV of these Standards.
2. CORPORATION STOPS: Corporation stops shall be similar to those manufactured by the Ford, shall be fitted with the proper adapter to the service line and shall conform to the several designations shown in the table below for the various sizes:

<table>
<thead>
<tr>
<th></th>
<th>WATER SERVICE CONNECTION SIZE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1/2&quot;</td>
</tr>
<tr>
<td>FORD</td>
<td>600</td>
</tr>
</tbody>
</table>

All services shall have a flare or compression type joint for the service pipe and threaded on the inlet end with an AWWA corporation stop thread.

3. METER SETTER YOKES: Meter setters or meter yokes shall be 18" high, Ford 70 series copper setter or equal, and shall have an AWWA approval, built-in back-flow device and inlet angle ball valve. All internal parts shall be accessible without removing the valve from the line. Meters shall only be installed by City Water Department personnel.

4. METER BOX AND LID: The meter boxes shall be white, high density polyethylene ADS N-12 or equal, 18" X 36" (standard size). The meter lids shall be cast iron, auto read. D & L Supply L-2241 with 2" hole (O.A.E.).

5. BUILDING SERVICE CONNECTIONS: At all points designated by the City Engineer, the owner shall install services for building connections, and shall extend such services to the property line, unless otherwise indicated by the City Water Department. Individual water services shall be 1 inch from the water main to the meter setter for normal domestic service, but may be one-and-one-half or two-inches in diameter as directed by the City Water Department. Services shall have a minimum of three feet of cover and be laid as shown in the standard drawings.

M. FIRE HYDRANTS: Fire Hydrants shall be Mueller, Kennedy, Model K81A, or approved equal with 5 1/2" dia. 3 nozzle  foot valve and 6" mechanical joint connection. Fire hydrants shall conform to the latest edition of AWWA C-502, "Dry Barrel Fire Hydrants." All hydrants shall be designed for a working pressure of 200 psi and a hydrostatic pressure of 350 psi. It shall be the responsibility of the Owner to furnish hydrants with a
finish paint above the ground line identical to the existing hydrant paint (red).

N. FLOWABLE BACKFILL: Flowable backfill material shall conform to the following:

1. Portland Cement - Type I, II or V Subsection 718.01.

2. Fly Ash - ASTM C-618, Class F, except loss on ignition shall not exceed three percent maximum, and shall come from a source approved by the City Engineer.

3. The coarse and fine aggregate for flowable fill shall be natural and consisting of mineral aggregate particles meeting the following:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent Passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>3/4</td>
<td>100</td>
</tr>
<tr>
<td>200</td>
<td>0-10</td>
</tr>
</tbody>
</table>

4. Mix Design - meet the following:

- Minimum compressive strength (28 days) 50 PSI
- Maximum compressive strength (28 days) 150 PSI
- Minimum fly ash per cubic yard 300 lbs.
- Maximum cement per cubic yard 25 lbs.
- Maximum slump 10 in.

4.2.2 CONSTRUCTION METHODS: This section covers the requirements for trenching, placement, and back filling of all underground pipelines (sewer, water, storm drains, etc.). The methods employed in performing the work shall be the responsibility of the developer. The developer shall make such changes in the methods employed as are necessary to install an acceptable finished product. These methods shall include but are not limited to the following:

I. CONTROL OF GROUND WATER: All trenches shall be kept free from water during excavation, fine grading, pipe laying, jointing, and embedment operations. Where the trench bottom is mucky or otherwise unstable because of the presence of ground water, and in cases where the static ground water elevation is above the bottom of any trench or bell hole excavation, such ground water shall be lowered to the extent necessary to keep the trench free from water and the trench bottom stable when the work within the trench is in progress. Surface water shall be prevented from entering the trenches.
II. EXCAVATION FOR PIPELINES: Trench excavation shall include all operations necessary for excavation of all materials of whatever nature falling within the designated lines of the trenches. Trenches shall be excavated to the lines shown on the drawings or otherwise established by the City Engineer, and to a depth so as to provide a minimum burial of three feet over the pipe unless otherwise specified. The bottom two feet of the trench walls shall be vertical. All finish grade excavation necessary for preparation of the trench bottom shall be made manually. No over-excavating shall be allowed without re-compaction of backfill in accordance with these Standards.

Excavation for trenches in ledge rock, cobble rock, or stones shall extend to a depth of at least four inches below the invert of the pipe. Bedding material as outlined in table 4.2 shall be placed and compacted to 95% of maximum dry density with pneumatic or vibratory tampers in six-inch lifts to provide a smooth, well compacted and stable foundation for the pipe or appurtenant works.

Trench bottoms shall be hand-shaped as specified and the maximum width of the trench, measured at the top of the pipe, shall be as narrow as possible, but not wider than 12 inches on each side of the pipe.

Where unstable earth, mud or muck is encountered in the excavation at the grade of the pipe, the unsuitable material shall be removed to a minimum of 12-inches below grade and the subsequent hole shall be backfilled with crushed rock or gravel (as called out in table 4.2 under "foundation material") to provide a stable subgrade. The gravel material shall be deposited over the entire trench width in a maximum of six-inch thick layers. Each layer shall be compacted by tamping, rolling, vibrating, spading, slicing, rodding or by a combination of one or more of these methods. In addition, the material shall be graded to produce a uniform and continuous support for the entire length of the installed pipe. When dealing with clays it may be required to replace all of the material with suitable fill (road base/sand) to provide a stable subgrade.

*To be used only when the trench bottom is unstable.
(The standard drawings show the typical trench backfill details.)

#### III. SHEETING, BRACING AND SHORING OF EXCAVATIONS:
All excavations shall be sheeted, braced, and shored as required to protect the workers and existing utilities and improvements from sliding, sloughing or settling of the trench walls while the work is in progress. All such sheeting, bracing and shoring shall comply with the requirements of the Utah State Industrial Commission. All damage resulting from lack of adequate sheeting, bracing and shoring shall be the responsibility of the Contractor, and the Contractor shall effect all necessary repairs or reconstruction resulting from such damage.

#### IV. BLASTING:
Blasting will not be allowed except by written permit from the Local Fire Chief. If the permit is granted, the Contractor shall comply with all laws, ordinances, and applicable safety code requirements and regulations relative to the handling, storage, and use of explosives and protection of life and property.

The contractor shall comply with the provisions outlined in the U.S. Bureau of Mines Bulletin No. 656 "Blasting Vibrations and their Effects on Structures", and other applicable ordinances as specified by the Fire Chief.

The contractor shall be fully responsible for all damage attributable to such blasting operations. Excessive blasting or overshooting will not be permitted and any material outside the authorized cross-section which may be shattered or loosened by blasting shall be removed and properly replaced.
V. PIPE LAYING AND BEDDING: Pipe will be carefully inspected in the field by City Inspectors before and after laying. If any cause for rejection is discovered in a pipe after it has been laid, it shall be removed and replaced by the Contractor.

When connections are to be made to any existing pipe, conduit, or other appurtenances, the actual elevation or position of which cannot be determined without excavation, the Contractor shall excavate for, and expose the existing improvement before laying any pipe or conduit. The City Inspector shall be given the opportunity to inspect the existing pipe or conduit before the connection is made. Any adjustments in line or grade which may be necessary to accomplish the intent of the plans will be made.

Pipe shall be laid up grade with the socket or collar ends of the pipe up grade unless otherwise authorized by the City Water Department and/or City Engineer.

Pipe shall be laid true to line and grade, with uniform bearing under the full length of the barrel of the pipe. Suitable excavation shall be made to receive the bell or collar, which shall not bear upon the subgrade or bearing. Any pipe which is not true to alignment or shows any settlement after laying, shall be removed and re-laid to the proper grade and alignment. Wherever possible, sanitary sewers shall be installed on the down-hill side of the street.

A. REQUIREMENTS FOR LINE AND GRADE: All sewer and drainage pipe shall be installed accurately to the defined line and grade within the following limits:

1. Variance from established line and grade shall be not greater than one thirty-second (1/32) of an inch per inch of pipe diameter.

2. The total variance from line and grade shall not exceed one-half (1/2) inch, provided that such variation does not result in a level or reverse sloping invert.

3. The variation in the invert elevation between adjoining ends of pipe, due to non-concentricity of joining surface and pipe interior surfaces, shall not exceed one sixty-fourth (1/64) of an inch per inch of pipe diameter.

4. The total non-concentricity variance shall not exceed one-half (1/2) inch maximum.

B. INSTALLATION OF PIPE. A groove shall be excavated in the bottom of the trench to receive the bottom quadrant of the pipe. Before preparing the
groove, the trench bottom shall be excavated or filled and compacted to an elevation sufficiently above the grade of the pipe so that, when completed, the pipe will be true to line and grade. Bell holes shall be excavated so that only the barrel of the pipe receives bearing from the trench bottom. Large rocks (over 6 inches in least dimension) near the surface shall be removed and the hole refilled with approved backfill in accordance with table 4.2.

Sewer and drain pipe shall be laid up grade. All pipe installation shall proceed with joints closely and accurately fitted. Gaskets shall be fitted properly in place and care shall be taken in joining the units to avoid twisting the gaskets. Joints shall be clean and dry and a joint lubricant, as recommended by the pipe supplier, shall be applied uniformly to the mating joint surfaces to facilitate easy and positive joint closures. If adjustments to the position of a pipe length is required after being laid, the pipe shall be removed and rejoined as for a new pipe. When laying is not in progress, the ends of the pipe shall be closed with a tight-fitting stopper to prevent the entrance of foreign material. In addition to the above requirements, all pipe installation shall comply to the specified requirements of the pipe manufacturer.

C. SETTING OF BENDS, TEES, CROSSES AND REDUCERS: Bends, tees, crosses, and reducers shall be lowered into the trench, inspected, cleaned and joined to the pipe.

Reaction or thrust blocking shall be applied at bends and tees, and at points of reducing or in fittings where changes in pipe diameter occur. The design of concrete thrust blocking shall be as shown in the Standard drawings or as directed by the City Water Department. The material for reaction or thrust blocking shall be Class C in accordance with Table 4.10 and Section 4.4 of these standards. Blocking shall be placed between solid ground and the fitting to be anchored. The area of bearing on the fitting and on the ground shall in each instance be that required in the drawings or by the City Engineer. Unless otherwise directed by the City Engineer, the blocking shall be placed so that the pipe and fitting joints will be accessible for repair in accordance with the Standard Drawings. Restraining joints (mega-lug or equal) shall also be used to prevent movement wherever thrust blocks are required.

D. PLUGGING OF DEAD-ENDS: Spigot ends of fittings and plain ends of pipe shall be capped. A concrete reaction or thrust block shall be provided at all plugged outlet fittings in the sizes indicated on the standard drawings or as directed by the City Engineer. They also shall be tied to the pipe with restraining joints.
E. SERVICE LINES: All service lines shall be installed according to the
details shown on the Standard Drawings.

F. PIPE TO BE KEPT CLEAN: All foreign matter or dirt shall be removed
from the interior of the pipe before lowering into position in the trench. Pipe
shall be kept clean by means approved by the City Engineer during and after
laying.

G. JOINTING PIPE SECTIONS: The sealing surface of the pipe, the bell
to be joined, and the elastomeric gaskets shall be cleaned immediately prior
to assembly, and assembly shall be made as recommended by the
manufacturer. When pipe laying is not in progress, the open ends of installed
pipe shall be closed to prevent entrance of trench water into the line.
Whenever water is excluded from the interior of the pipe, enough backfill
shall be placed on the pipe to prevent floating. Any pipe that has floated
shall be removed from the trench and the bedding restored. No pipe shall be
laid when the trench conditions or the weather are unsuitable for proper
installations as determined by the City Engineer.

H. CUTTING PIPE: The pipe shall be cut in a neat manner without damage
to the pipe so as to produce a smooth end at right angles to the axis of the
pipe.

I. END PREPARATION: Pipe ends shall be cut square, deburred and
beveled in accordance with the pipe manufacturer's recommendations.

J. PUSH-ON JOINTS: The push-on joint shall be a single elastomeric
gasketed joint which shall be assembled by positioning the elastomeric
gasket in the annular groove of the bell and inserting the spigot end of the
pipe into the bell. The spigot end of the pipe shall compress the gasket
radially to form a positive seal. The gasket and annular groove shall be
designed, sized and shaped so that the gasket will resist displacement. Care
shall be taken so that only the correct elastomeric gasket, compatible with
the annular groove of the bell, is used. Insertion of the elastomeric gasket in
the annular groove of the bell must be in accordance with the manufacturer's
recommendations.

K. MECHANICAL JOINTS: The mechanical joint shall be a bolted joint of
the stuffing box type, and installation recommendations from the
manufacturer shall be followed. Each joint shall consist of:
1. A bell provided with an exterior gland having bolt holes or slots and a socket with an annular recess for the sealing gasket and the spigot end of the pipe.

2. A sealing gasket.

3. A follower gland with bolt holes matching those in the fitting.

4. Tee bolts and hexagonal nuts of cor-ten metal.

L. METER BOXES: All meter boxes shall be located on the city side of a property line between two lots. Any meter box covered or damaged during the construction operations shall be replaced or uncovered and raised to finish grade by the Contractor.

M. PIPE BEDDING. Pipe shall be protected from lateral displacement and possible damage resulting from impact or unbalanced loading during backfilling operations by being adequately bedded in accordance with the bedding details in the standard drawings.

Pipe bedding materials shall be deposited and compacted in layers not to exceed six inches in compacted thickness. Deposition and compaction of bedding materials shall be done simultaneously and uniformly on both sides of the pipe. Compaction shall be accomplished with hand or mechanical compactors. All bedding materials shall be placed in the trench with hand tools or other approved methods in such a manner that the bedding materials will be scattered alongside the pipe and not dropped into the trench in compact masses. Bedding materials shall conform to the requirements of table 4.2 of these standards and shall be free from roots, sod, or other vegetation.

In the event trench materials are not satisfactory for pipe bedding, imported bedding will be required. Imported bedding shall consist of placing compacted granular material on each side of and to the level of twelve inches above the top of the pipe. Imported bedding materials shall be graded in accordance with table 4.2, under "bedding material".

VI. BACKFILLING AND COMPACTION: Backfill shall be carefully placed around and over pipes and shall not be permitted to fall directly on a pipe from such a height, or in such a manner as to cause damage. Backfill material shall be as required by table 4.2 or as approved by the City Engineer and shall not contain any wood, grass, roots, broken concrete, frozen soil, asphalt chunks, trash or debris of any kind that may cause unequal settlement or improper consolidation.
The backfill in all utility trenches under proposed or existing roadways, drainage structures, and driveways shall be compacted to the equivalent of 95% of maximum dry density for granular soils or 90% of maximum dry density for silty/clay soils as classified by AASHTO M-145 Soil Classification System. In shoulders and other street right-of-way areas, the in-place density shall be a minimum of 90% of the maximum dry density.

A. INITIAL BACKFILL PROCEDURE. Backfill of selected material which shall conform to the requirements of table 4.2 shall be placed carefully in eight-inch non-compacted horizontal layers and tamped to a depth of 8 to 12 inches over the top of the pipe. During compaction of the initial backfill, special care shall be taken so as to not move the pipe, either vertically or horizontally. All backfill operations shall be performed in such a manner so as to avoid any damage to the pipe, valves, laterals, etc. In the event such damage or displacement occurs, such damaged or displaced pipe shall be removed and replaced with undamaged pipe on proper grade and alignment.

B. FINAL BACKFILL PROCEDURE. The backfill above a point 8 to 12 inches above the top of the pipe shall be backfilled in horizontal layers 12 inches thick or less with materials containing no brush, perishable or objectionable material, or rocks, stones or boulders larger than 8-inches in the greatest dimension. The material shall be mechanically compacted with appropriate vibrating compaction equipment.

C. MECHANICAL COMPACTION OF BACKFILL. The backfill shall be thoroughly compacted by consolidation or mechanical compaction.

Structural and trench backfill shall be deposited in horizontal layers and compacted by the following method in such manner that the compacted material will be homogeneous and free from lenses, pockets, streaks, and other imperfections.

The materials shall be deposited in horizontal layers (across the length or width of the excavation of not more than six inches compacted thickness. The excavation and placing operations shall be such that the materials when compacted will be blended sufficiently to secure the best practicable degree of compaction, impermeability and stability.

Prior to and during compaction operations, all backfill material shall have the optimum practicable moisture content and shall be uniform throughout each layer.
Moisturizing of the materials shall be performed at the site of excavation. If the moisture content is not optimum for compaction, the compaction operations shall be delayed until such time that the material has been brought the optimum moisture content. When the material has been properly conditioned, it shall be compacted by using appropriate mechanical compaction equipment as indicated below.

1. **Vibrating Rollers** shall consist of a self-propelled roller with a vibrating steel drum of at least one-ton capacity. The roller shall have an effective rolling width of at least 24 inches and shall deliver a compaction force of at least 700 pounds per square inch when vibrating.

2. **Pneumatic rollers** shall consist of a self-propelled roller with pneumatic tires arranged in a manner so as to provide a satisfactory compacting unit. The roller shall have an effective rolling width of at least 30 inches and shall give a compaction force of at least 500 pounds per inch of width of tread when fully loaded. The tires shall be uniformly inflated.

3. **Vibrating plates** shall consist of a pneumatic vibrating plate attached to the boom of a backhoe and capable of compacting an area of at least three square feet. The plate and backhoe combination shall together be capable of exerting a compactive force of at least 1,000 pounds per square inch.

4. **Hand Compactors** shall be used when hand-compacted methods are specified or required because the location of the area to be compacted does not permit the use of self-propelled mechanical compactors. Vibrating plates, "pogo-stick" tampers or other approved hand-compacting equipment shall be used.

5. **Jetting and Flooding** methods are not permitted.

**D. FLOWABLE BACKFILLING:** In the pavement sections on all existing City streets and State highways, flowable fill shall be used (unless otherwise approved by the City Engineer) for backfill and shall be in conformance with the standards of "Flowable Fill" as described herein. Flowable fill shall be discharged from the ready mix truck by any reasonable means into the trench to be filled. The fill will be brought up to the bottom of the surface course and shall be finished to provide a uniform surface.
VII. TRENCHES ON HIGHWAYS AND STREETS: Wherever trenches will be
or must cross State highways or streets, the contractor shall obtain such excavat-
ion permits as are required for these crossings and shall become familiar with and abid-
by the rules and directions of the Utah Department of Transportation while working
in these streets.

All contractors excavating in any Enoch City public right-of-way shall obtain a Road
Breaking Permit in compliance with the Enoch City street ordinance prior to
evacuating.

All asphalt cuts shall be made with a diamond or carbide-tipped masonry or asphalt
cutting saw or with a steel asphalt-cutting wheel attached to a grader or back-hoe.
No scarifier-tooth cuts, back-hoe, bucket rips, or jackhammer spade cuts will be
allowed.

All backfilled trenches in roadways shall be patched with hot-mix asphalt within
fourteen days of initial excavation unless otherwise directed by the City Engineer.
The backfill section shall be according to the typical road sections of these standards.

All concrete or asphalt surfaces damaged or cut in trenching operations shall be
restored to an as-good or better condition than prior to excavation in accordance with
the provisions outlined in section 4.3 of these standards.

During the entire trenching, backfilling and patching operations, the Contractor will
be required to observe all safety and traffic control procedures as outlined in these
standards.

The contractor shall be responsible for maintenance of the trench and patch for a
period of 18 months from the date of the completion of the patching operation.

Unless otherwise approved by the City Engineer, not more than 400 feet of trench
shall be left unfilled at any time in one continuous run.

All streets and roads trenched shall be kept free from dust and open to through traffic
unless permission to close the street is obtained by the Contractor from the City
Engineer. Up to one-half the width of any street or road shall be temporarily
restored for use before excavation is commenced on the remaining portion of the
street or road. All excavation, backfilling and temporary resurfacing on any portion
of any street or road shall be completed in one working day so that no trenches are
left open over night.
VIII. CLEANING OF SANITARY SEWER LINES: After all sewer lines have been laid and the trench backfilled, the sewer lines shall be thoroughly cleaned prior to acceptance by the City.

Cleaning shall be accomplished by introducing sufficient water at the upper end of the trunks and laterals to flush the lines completely clean of all foreign material. No debris shall be permitted to enter any sewer lines in service. All debris shall be removed at the lowest manhole of the extension. Other methods of cleaning may be used subject to approval by the City Engineer. After the lines have been thoroughly cleaned, they shall be tested between each manhole for displacement.

IX. CLEANING AND DISINFECTION OF WATER SYSTEMS: Each line, after being tested and before being placed in service, shall be disinfected by chlorination. Prior to chlorination the entire line shall be flushed to insure that all dirt or foreign objects have been removed from the line. The line used to flush the line shall be six-inch minimum and no fire hydrants shall be used for flushing. Sufficient chlorine shall be added to insure a residual of twenty-five parts per million in the water after twenty-four hours standing in the pipe. Chlorine calcium hypochlorite dry chlorinating chemical solution may be used for this purpose. Methods of application shall be approved by the City Water Department. Following chlorination, all treated water shall be drained and the pipeline thoroughly flushed with clean water.

The entire line shall be flushed after the specified contact period, and such flushing shall be continued until the water is free from excess chlorine. The entire line, including hydrant laterals, branch lines, and dead-end mains shall be flushed. Chlorine residual must be tested after final flushing by the City Water Department. The discharge of flushed water shall be accomplished in such a manner that no erosion will occur and with no damage to streets or other property. Procedures for discharge will be subject to the review of the City Engineer and City Water Department.

4.2.3 QUALITY CONTROL. All underground pipelines shall be installed in accordance with these standards and tested as outlined below.

I. TRENCH BACKFILL MOISTURE/DENSITY TESTING.

Soil Proctor

One determination for each significant change in soil type as necessary to provide required compaction testing. Tests shall be ASTM D1557 Method A or D (modified proctor).
Trench backfill moisture/density determination - Tests are required for trench backfill for every 200 lineal feet of trench including service lateral trenches, or other utility trench or portion thereof, and each manhole, valve or set of valves within a 10-foot diameter that comes to the surface in the street section. Tests shall be run at the following trench elevations:

One test at top of pipe zone.

One test per 2 feet of depth measured from the bottom of the subgrade to the top of the pipe zone. Tests shall be evenly spaced vertically through the trench with one test at top of trench (bottom of subgrade).

Additional testing may be required by the City Engineer or soils testing lab to verify compaction.

Tests shall be according to ASTM D1556 or D2922 and D3017.

II. SANITARY SEWER LINE TEST AND ACCEPTANCE. This section specifies requirements for determining the acceptability of sewer systems after all sewer lines have been cleaned. The sewer lines, service laterals and manholes shall be tested for leakage and alignment in the presence of the City Engineer as follows:

A. DISPLACEMENT TEST. The displacement test shall be conducted by the Contractor in accordance with the following procedure:

A light shall be flashed between manholes or, if the manholes have not as yet been constructed, between the locations of the manholes, by means of a flashlight or by reflecting sunlight with a mirror. If the illuminated interior of the pipe shows broken, misaligned or displaced pipe, or other defects, the defects designated by the City Engineer shall be remedied by the Contractor. After cleaning and inspection have been completed, the line shall be tested for leakage.

B. AIR TESTING. The reach of pipe to be tested shall be isolated by completely blocking all outlets in the section under test. Careful attention shall be given to blocking all plugs. Prior to installing the lower and upper plugs, concrete pipe and manholes shall be wetted to minimize any loss of

4-32
air through the pipe or manhole walls as a result of permeability in the dry condition. One of the plugs used at the manhole must be equipped to control the air entry rate and to prevent the pressure from exceeding five p.s.i.g., this shall be done by means of a blow-off valve set to operate a five p.s.i.g.

After the concrete pipe has been wetted and plugs installed, the air shall be allowed to slowly fill the pipe until a constant pressure of 4.0 p.s.i.g. is maintained for at least two minutes. During the two-minute stabilization period, all plugs and exposed fittings shall be checked with a soap solution. If a leak is found, the air shall be bled off, the leak repaired and a new two-minute stabilization period begun. When the temperature of the air has reached equilibrium with that of the pipe wall, the air pressure shall be brought to 4 p.s.i.g. and the supply shall then be disconnected. When the pressure gauge reaches 3.5 p.s.i.g., a stop watch shall be started and then stopped when the pressure reaches 2.5 p.s.i.g. The time required as shown on the watch for a loss of 1 p.s.i.g. at an average pressure of 3.0 p.s.i.g. is used to calculate the rate of air loss. The pipeline may be considered to have passed the air loss test successfully if the loss of air is not greater than a rate of 0.0030 cubic feet per minute per square foot of internal pipe surface. The following table shows the allowable time for the pressure to drop from 3.5 to 2.5 p.s.i.g. for respective pipe diameters.

</tbody>
</table>

C. EXFILTRATION TEST. In lieu of the standard sanitary sewer air test, the Contractor may make an exfiltration test in accordance with the following procedure:

The test section shall be blocked at both ends and the pipe subjected to a hydrostatic pressure produced by a head of water at a depth of three feet above the invert of the sewer at the upper manhole under test. In areas where ground water exists, the head of water shall be three feet above the existing water table.

4-33
For concrete pipe, the three-foot head of water shall be maintained for a period of one hour to obtain full absorption of the pipe body and thereafter for a further period of one hour for the actual test leakage. For all other types of pipe, the three-foot head of water shall be maintained for a period of one hour only. During the one-hour test period the measured maximum allowable rate of exfiltration for any section of sewer, including service stubs, shall be as listed below:

<table>
<thead>
<tr>
<th>SEWER MAIN DIAMETER (inches)</th>
<th>MAXIMUM DROP IN HEAD IN A 4-FT. DIAMETER MANHOLE (Non-taper sect.) per 100 ft. of sewer pipe</th>
<th>MAXIMUM ALLOWABLE EXFILTRATION (Gallons/Hour/100 ft.)</th>

</tr>
</tbody>
</table>

In case measurements indicate an exfiltration greater than the maximum allowable leakage, additional measurements shall be taken and continued until all leaks are located and the necessary repairs and corrective work have reduced the leakage in the section being tested below the maximum allowable by these standards. For purposes of the test, the line between adjoining manholes will be considered a section and will be tested as such.

The Contractor shall furnish the plugs and other material and labor for placing the plugs in the sewer and shall assist the City Engineer in making all measurements required. The introduction of any substance into the water used for testing with the intent of sealing such leaks as may be indicated will not be permitted.

If results of either the air test or the exfiltration test is not satisfactory, repairs or pipe replacement shall be required until the City Engineer is satisfied that the leakage requirements are being met. All repair methods and materials used must be accepted by the City Engineer.

D. PVC DEFLECTION TEST. All PVC pipe shall be mandrelled with a rigid device sized to pass through the pipe with five-percent or less deflection.
of the pipe. These allowances shall include deformations due to all causes (wall thickness variations, shipping, production, backfill, heat, etc.). The mandrel device shall be cylindrical in shape and shall comply with the manufacturer's recommendations.

The mandrel shall be hand pulled by the contractor through all sewer lines. Any sections of sewer not passing the mandrel shall be uncovered and the contractor shall re-round or replace the sewer to the satisfaction of the City Engineer and all repaired sections shall be re-tested.

The deflection test shall be conducted after reaching final trench backfill grade and compaction.

E. INSPECTION AND FLUSHING: Prior to final acceptance of each section of sanitary sewer line, the Contractor shall flush all sewer lines. All dirt and debris shall be prevented from entering the existing sewer system by means of water-tight plugs or other suitable methods. Upon completion of the project, the City Engineer will carefully inspect all sewers and appurtenances. Any unsatisfactory work shall be removed and replaced in a proper manner. The invert of the sewer and manholes shall be left smooth, clean, and free from any obstructions throughout the entire line. All manhole rings and covers shall be adjusted to finished grade and concrete collars installed prior to acceptance of the sewer system.

F. MANHOLE LEAKAGE TEST: Sewer manholes shall be tested for leakage prior to acceptance if they are located in areas of probable flooding or high water table, or if their tightness is suspect, as determined by the City Engineer. Allowable leakage shall be one gallon per hour per manhole. At least two manholes shall be tested, and based on these tests and visual inspection of all manholes, additional tests may be required for other manholes. Any manhole which tests unsatisfactorily shall be repaired and retested until satisfactory results are obtained.

III. WATER SYSTEM TESTING AND ACCEPTANCE: The Owner and/or Contractor shall disinfect and test all water mains prior to final acceptance by the City. This shall include the repairing of existing facilities that must be included in the test but are not capable of holding test pressures. All concrete reaction blocks shall be in place at least five days before the initial filling of the line, unless high early strength concrete is used which will require three days in place. In some cases initial filling can take place the same day if precast reaction blocks are used.
A. PRESSURE TEST: After the pipe has been laid, including fittings, valves, corporation stops, services, and hydrants, and the line has been backfilled in accordance with these standards, each valved section, unless otherwise directed by the City Water Department, shall be subjected to hydrostatic pressure of not less than 200 pounds per square inch. The duration of each such test shall be two hours. Water added to maintain the pressure shall not exceed 0.4 gallons per inch diameter per 1000 lineal feet of main being tested during the two-hour test period.

Each valved section of pipe shall be slowly filled with water, and the specified test pressure measured at the lowest point of elevation. This shall be applied by means of a pump connected to the pipe in a satisfactory manner. The pump, pipe connection, gauges, and all necessary apparatus shall be furnished by the Owner. Gauges and measuring devices must meet with the acceptance of the Water Department and the necessary pipe taps shall be made as directed. Before applying the specified test pressure, all air shall be expelled from the pipe by drilling small holes at points of highest elevations and afterward tightly plugging those holes with brass plugs.

Any cracked or defective pipes, fittings, valves, or hydrants discovered in the pressure test shall be removed and replaced with sound material in the manner provided. The test shall be repeated until the water main passes the pressure test and is accepted by the City Water Department or City Engineer.

B. OPERATIONAL INSPECTION: At the completion of the project and in the presence of the City Engineer, the Owner shall operate all valves, hydrants, and water services to ascertain that the entire facility is in good working order; that all valve boxes are centered and valves are operational; that all hydrants operate and drain properly and that water is available at all meter boxes.

4.3 ROADWAY CONSTRUCTION This section covers the requirements for construction of roadway pavements including base course, bituminous prime coat, bituminous surface course, bituminous seal coat and street signs.

Pavement structure shall comply with Table 4.3 unless required engineering and Geotechnical studies support another preferable design.

**4.3.1 MATERIALS:** Roadway construction materials in City improvements shall conform to the following:

1. **BASE COURSE MATERIAL:** Base for all streets shall consist of select material, either pit run or road base. Prior to placing untreated base course, the Contractor shall submit, in writing, a job-mix gradation to the City Engineer for approval. The job-mix gradation shall have definite single values for the percentage of aggregate sizes.

   A. **PIT RUN:** Pit run materials shall be deposited, spread and compacted on the scarified and compacted nature soil. The material used for Pit Run in all streets shall conform to the following:

   1. Pit run shall consist of hard tough, and sound mineral aggregates that consist of native gravel free of deleterious and/or organic materials.

   2. All gravel pits supplying aggregate must be UDOT approved pits with the material conforming to State of Utah Standard Specification for Road and Bridge Construction, Section 301.

   3. The gradation for the pit run material shall meet the gradation shown in Table 4.4.

B. ROAD BASE MATERIAL: Road base material shall be deposited, spread and compacted on the finished Pit Run or scarified and compacted native soil as required. The material used for Road Base shall conform to the following:

1. Road base for all streets shall consist of clean, hard, tough, durable and sound mineral aggregates that consist of crushed stone, crushed gravel, or crushed slag; free of deleterious and/or organic materials.

2. Dry-rodded unit weight shall be at least 75 pounds per cubic foot.

3. Material-passing the number 40 sieve shall be non-plastic.

4. Aggregate wear under ASTM-C-131 or AASHTO T-96 shall be less than 50%.

5. All gravel pits supplying aggregate must be UDOT approved pits.

6. The "Job Mix Target" gradation of the aggregate shall fall within the band limits shown on Table 4.5.

II. **BITUMINOUS PRIME COAT MATERIAL:** The bituminous prime coat shall consist of an application of hot bituminous material on a previously prepared surface course. When required, bituminous material for the prime coat shall be MC-70.

III. **BITUMINOUS SURFACE COURSE MATERIAL:** Over the cured prime coat when required or over the prepared base course, the Contractor shall place and compact a bituminous surface course. The surface course shall consist of a mixture of materials of mineral aggregate and bituminous binder.

A. **AGGREGATE:** The supplier shall submit a design mix to the City Engineer for approval prior to the commencement of each construction season or upon selection of new aggregate sources. The design mix gradation shall meet the specified gradations shown in Table 4.6 unless other job-mix designs are submitted and approved by the City Engineer prior to laying and conform to Table 4.9 of these Standards.

**B. BITUMINOUS MATERIAL:** The bituminous material shall be either AC-20 (AR-8000) or AC-10 (AR-4000) in accordance with the Asphalt Institute specifications unless otherwise specified by the City Engineer.

**IV. BITUMINOUS SEAL COAT MATERIAL:** (ASPHALT EMULSION/FLUSH COAT) Bituminous surface treatment (Flush Coat) shall be applied to the road surface of all new streets and other existing streets when required by the City Engineer. The bituminous surface treatment shall consist of an application of asphalt emulsion over the bituminous surface course. The materials used in the application of the bituminous surface treatment shall be asphalt emulsion and blotter sand when required. The materials for this seal coat are as follows:

**A. ASPHALT EMULSION:** The asphalt emulsion shall conform to the specifications outlined in Table 4.7.

**B. BLOTTER SAND** shall consist of pit reject sand with no particle larger than 1/8 inch.

V. BITUMINOUS SEAL COAT MATERIALS: (CHIP SEAL) Bituminous surface treatments (chip seals) shall be applied to the road surface only when required or approved by the City Engineer. The bituminous surface treatment shall consist of an application of bitumen covered with mineral aggregate and
rolled to a smooth surface presenting an even texture, then coated with asphalt emulsion. The materials used in the application of the bituminous surface treatment shall be bituminous mineral, mineral aggregate, and asphalt emulsion specified as follows:

A. BITUMINOUS MATERIAL: The bituminous material shall be cationic emulsified asphalt (type CRS-2), with a Saybolt Furol viscosity (at 122 degrees Fahrenheit) of between 300 and 400 seconds, and shall conform to the requirements as outlined in AASHTO Designation M208. The bituminous material shall also conform to the following requirements:

1. Sieve limit of 0.10 percent.
2. The particle charge shall be positive.
3. The Residue by evaporation shall be 65 percent by weight, minimum.
4. The results of the test on residue from distillation (tested in accordance with ASTM D-244) shall be as follows:

B. AGGREGATE (CHIPS): Mineral aggregate shall consist of crushed stone or crushed gravel, free from adherent films of clay or dust, and shall be of such nature that a thorough coating of the bituminous material used in the work will not strip off upon contact with water.

The gravel or rock shall have a percent of wear not greater than 30 when tested by the Los Angeles Abrasion Test (AASHTO T-9 ASTM C 131). Chips shall be cubical or pyramidal in shape with at least 95% fractured faces. The crushed aggregate shall have a weighted percent of loss not exceeding 10 percent by weight when subjected to five cycles of sodium sulfate and tested in accordance with AASHTO Designation T-104.

4-42
Stripping tests of the mineral aggregate which the Contractor proposes to use shall be furnished to the City Engineer before crushing operations begin. During the crushing of the aggregate, additional stripping tests shall be furnished to the City Engineer upon request. No stripping test shall show a percent stripping greater than 10 for CRS-2 asphalt. The chip shall be electrically compatible to the asphalt emulsion used.

The crushed aggregate shall conform to the gradation requirements shown in table 4.8.

The initial mineral aggregate used for the production of chips shall be retained on a 5/8 inch sieve prior to being crushed to the gradation specified.

C. ASPHALT EMULSION: See Section 4.3.1 IV

VI. STREET SIGN MATERIALS: Street sign materials shall conform to the following standards with the dimensions as indicated in the standard drawings:

A. ALUMINUM SIGN BLANKS: The aluminum sign blanks shall be either extrusion aluminum, 0.080 inch thick ASTM B209 Alloy 6061-T6 or 6063-T5 and 6063-T6.

B. SIGN POSTS: Sign post shall be galvanized, 3/32 inch structural steel, ASTM A36, 2 inch square, perforated with 3/8 inch diameter holes, 1 inch on center on all four sides or pressure treated wood 4"x4".
C. MOUNTING SLEEVES & ANCHORS: Mounting sleeves and anchors shall be the same as the sign post except 2 1/4 and 2 1/2 inch square respectively.

D. REFLECTIVE SHEETING: Sign reflective sheeting shall be FS L-S-300 with 2200 hours minimum durability.

E. SIGN HARDWARE: All sign hardware shall be galvanized, ASTM A307 steel dimensioned according to the standard drawings.

F. SIGN COLORS AND FORMAT: Sign colors and format shall conform to ANSI D6.1 and The Manual on Uniform Traffic Control Devices.

4.3.2 CONSTRUCTION METHODS AND EQUIPMENT: The methods employed in performing the work and all equipment, tools and machinery and other appliances used in handling the materials and executing the work shall be the responsibility of the Contractor. The Contractor shall make such changes in the methods employed and in the equipment used as are necessary whenever the road construction materials that are being installed do not meet the specifications herein established.

I. PIT RUN CONSTRUCTION METHODS AND EQUIPMENT: The methods employed in installing Pit Run shall include but not be limited to the following:

A. When mixing and placing, the moisture content of the pit run shall be maintained at optimum, when tested, plus or minus 2%.

B. When placing, the layers shall be of equal thickness not to exceed 6" in thickness.

C. Do not place Pit Run on frozen subgrade or native material.

D. Do not place additional material on any unacceptable layer.

E. Material shall be deposited and spread in uniform lifts not to exceed six-inch compacted thickness, without segregation of size. When compacted, the Pit Run shall meet the required thickness.

F. Each layer shall be compacted for the full width and depth by rolling with a pneumatic roller weighing at least 10 tons. Alternate blading and rolling will be required to provide a smooth, even and uniformly compacted course true to cross-section and grade. Places inaccessible to rolling shall be compacted with mechanically operated hand tampers. The
Pit Run shall be compacted to not less than 95% maximum dry density as determined by ASTM D-1557.

G. Surfaces shall be true to the established grade with thickness varying not more than 1 inch from the required layer thickness. Finish grade shall be established with hubs placed at 50-foot maximum spacing on centerline and shoulders.

II. ROAD BASE CONSTRUCTION METHODS AND EQUIPMENT: The methods employed installing road base shall include but are not limited to the following:

A. When mixing and placing, the moisture content of the untreated base course shall be maintained at optimum, when tested, plus or minus 2%.

B. When placing, the layers shall be of equal thickness not to exceed 6" in thickness.

C. Do not place road base on frozen subgrade, sub-base or on a frozen layer of road base. No road base shall be installed from November 1st to April 1st unless approved by the City Engineer.

D. Do not place additional material on any unaccepted layer.

E. Material shall be deposited and spread in uniform lifts not to exceed six-inch compacted thickness, without segregation of size. When compacted the Road Base shall meet the required thickness.

F. Each layer shall be compacted for the full width and depth by rolling with a pneumatic roller weighing at least 10 tons. Alternate blading and rolling will be required to provide a smooth, even and uniformly compacted course true to cross-section and grade. Places inaccessible to rolling shall be compacted with mechanically operated hand tampers. The Road Base shall be compacted to not less than 95% maximum dry density as determined by ASTM D-1557.

G. Surfaces shall be true to the established grade with thickness varying not more than 1/4 inch from the required layer thickness. Finish grade shall be established with hubs placed at 50-foot maximum spacing on centerline and shoulders.
III. BITUMINOUS PRIME COAT CONSTRUCTION METHODS: The methods employed in installing Bituminous Prime Coat shall include but are not limited to the following:

A. PREPARATION: Immediately prior to the application of the prime coat, all loose material, dirt, clay, or other objectionable material, shall be removed from the surface to be primed. After the cleaning operation, and prior to the application of the prime coat, the surface shall be steel rolled and lightly sprinkled with water immediately in advance of the application as directed by the Engineer, to assure a uniform spread of the bituminous material.

B. APPLICATION: Immediately following the preparation of the base course, the bituminous prime material shall be applied at the rate of .25 gallon per square yard of surface course by means of a bituminous distributor at the temperature specified. The asphalt distributor shall be equipped with a calibrated dipstick marked in gallons per inch of length, and an accurate thermometer and speedometer. The distributor shall also be able to maintain the correct pump speed of pressure without either atomizing the asphalt or distorting the spray fan. However, the pump shall be able to maintain a pressure which shall be sufficient to prevent streaking from a non-uniform discharge of material from the individual nozzles.

The asphalt distributor shall be equipped with a rear mounted spray bar capable of covering widths of 6 to 15 feet in a single pass. The distributor tank shall be well insulated and be equipped with one or more heaters capable to bringing the asphalt material to spray application temperature. The tank shall have a full circulating system with an engine-driven pump. The circulating system shall include the spray bar unit. The truck shall also be equipped with a hand-spray for applying the asphalt material to areas that cannot be reached with the spray bar.

The distributor shall be equipped with charts for determining the discharge for each nozzle's size, the proper truck speed for various application rates, and the correcting of temperature-viscosity variations. The operator of the asphalt distributor shall be capable of applying the material as specified. If the operator is incapable of performing the work, at the request of the City, he/she shall be removed.

C. CURING: Following the application of prime material, the surface shall be allowed to dry for a period of not less than 48 hours without being disturbed, or of such additional period of time as may be necessary to
attain penetration into the foundation course and drying out or evaporation of the volatiles from the prime material, which period shall be determined by the City Engineer. The Contractor shall furnish and spread sufficient approved sand on all areas which show an excess of bituminous material to effectively blot up and cure the excess, as directed by the City Engineer. The primed surface shall be maintained by the Contractor and he/she shall repair all broken spots.

D. WEATHER LIMITATIONS: Bituminous material for the prime coat shall only be applied when the minimum temperature of the air or road bed is 50 degrees and rising. Application conditions shall be subject to the discretion of the City Engineer.

IV. BITUMINOUS SURFACE COURSE CONSTRUCTION METHODS AND EQUIPMENT: The methods employed in installing Bituminous Surface Course shall include but are not limited to the following:

A. MIXING: The bituminous surface course shall be mixed at a mixing plant and spread and compacted on the prepared base in conformance with the lines and dimensions shown on the plans and in accordance with these Standards.

The combined mineral aggregate plus any specified additives when mixed with the specified bituminous binder in accordance with ASTM Designation D-1559 shall conform to the requirements shown in Table 4.9.

</tbody>
</table>

B. SPREADING: The bituminous mixtures shall be spread with self-propelled mechanical spreading and conditioning equipment capable of distributing at least a 12-foot width. The spreader shall be equipped with an automatic leveling screed. The mixture shall be spread and struck
off in such a manner that the finished surface will result in a uniform smooth surface. The longitudinal joints in succeeding courses shall be off-set at least 12 inches vertically to avoid a vertical joint through more than one course. All transverse joints shall be offset from one another at least four feet longitudinally, except as required by the City Engineer. The temperature of the bituminous mix shall be between 250 degrees and 325 degrees F. when placing.

C. COMPACATION: After the mixture has been spread, the surface shall be rolled in longitudinal direction commencing at the outside edge or lower side and proceeding to the higher side. Each pass of the roller shall overlap the preceding pass at least one-half the width of the roller. Rolling shall continue until 96% of the laboratory bulk density has been obtained. Rolling operations shall be conducted in such a manner that shoving or distortion will not develop beneath the roller. The surface of the pavement, after compaction, shall be uniform and true to the established crown and grade. All traffic shall be kept off the surface until rolling is completed.

D. TEMPERATURE LIMITATIONS: No bituminous surface course shall be placed when the temperature of the air or road bed is 50 degrees F. or below; during rainy weather; when the base is wet; during the period from November 1st through April 1st or during other unfavorable conditions as determined by the City Engineer. However, minor repairs will be allowed during winter months. The air temperature shall be measured in the shade. The temperature of the bituminous mix shall be between 250 degrees and 325 degrees F. when placing.

V. BITUMINOUS FLUSH COAT CONSTRUCTION METHODS: The methods employed in installing Bituminous Flush Coat shall include but are not limited to the following:

A. SURFACE PREPARATION: The Contractor shall thoroughly remove all dust, dirt, tracked on clay and foreign material from the surfaces to be sealed by sweeping the surface with power brooms, hand brooms, power blowers, or by flushing it with water or a combination of the above. All patching, crack filling and drainage improvements shall be completed prior to the commencement of the surface treatment project. After the cleaning operation has been completed, and prior to the application of the surface treatment, the area to be treated will be inspected by the City Engineer to determine its fitness for receiving the surface treatment.
B. EMULSION APPLICATION: Anionic emulsion shall be used and shall be applied at the rate of 0.08 to 0.20 gallons per square yard as determined by the City Engineer. The asphalt emulsion shall be diluted at the rate of 1:1 with potable water. An asphalt distributor conforming to Section 4.3.2.III.B shall be used to apply the emulsion at the specified temperature.

C. BLOTTING: Any excess emulsion that does not cure after 2 hours shall receive a covering of blotter sand.

D. WEATHER LIMITATION: The flush coat shall be placed only when the air temperature in the shade and the road bed temperature are above 50 degrees F. The flush coat shall not be placed when the temperature of the road surface is above 130 degrees F., during rainy weather, when the road is wet or during other unfavorable weather conditions as determined by the City Engineer.

VI. BITUMINOUS CHIP SEAL CONSTRUCTION METHODS: The methods employed in installing Bituminous Chip Seal shall include but are not limited to the following:

A. SURFACE PREPARATION: The Contractor shall thoroughly remove all dust, dirt, tracked on clay and foreign material from the surfaces to be sealed by sweeping the surface with power brooms, hand brooms, power blowers, or by flushing it with water or a combination of the above. All patching, crack filling and drainage improvements shall be completed prior to the commencement of the surface treatment project. After the cleaning operation has been completed, and prior to the application of the surface treatment, the area to be treated will be inspected by the City Engineer to determine its fitness for receiving the surface treatment.

B. ASPHALT APPLICATION: The asphalt material shall be applied at 0.40 to 0.60 gallon per square yard as determined by the City Engineer and at a temperature between 125 degrees to 185 degrees Fahrenheit. The exact temperature used to apply the bituminous material shall be determined by the City Engineer. Application of the asphalt shall not be permitted to begin until the loaded aggregate trucks are in place and ready to apply the cover aggregate. The bituminous material shall be applied by an asphalt distributor as described in Section 4.3.2.III.B so that uniform distribution in the quantities specified is obtained over all points of the surface to be treated. All lightly-coated areas and spots missed by the distributor shall be properly treated with bituminous material applied by hand. No more asphalt shall be applied than can be covered with
aggregate in 30 seconds or less. Distances between the distributor and chip-spreader shall be as close as possible, but in no case shall the chip-spreader be greater than 50 feet behind the distributor during the chipping operations.

**C. AGGREGATE SPREADING:** Immediately following the application of the bituminous material, the aggregate shall be evenly spread at a uniform quantity of 15 to 20 pounds per square yard of surface area. Upon commencement of the work, and during its progress, the individual quantities of bitumen and aggregate may be varied to meet specific field conditions, as directed by the City Engineer. An adequate supply of aggregate shall be available on the job site to permit continual spreading operations. The aggregate shall be spread by using a self-propelled spreader (flarity or equal). The aggregate shall be spread evenly by hand on all areas missed by the aggregate spreader. Back-spotting or sprinkling of additional aggregate over the areas having insufficient cover shall be done by hand and shall be continued during the operations whenever necessary.

As the distributor moves forward to spray the asphalt, the aggregate spreader shall start right behind it, spreading the chips uniformly and at the specified rate. The asphalt distributor shall travel at the same rate of speed as the chip spreader and in no case shall the two machines be separated by more than 50 feet during the sealing process. Operating the chip spreader at speeds which cause the chips to roll over after striking the bituminous-covered surface will not be permitted.

**D. AGGREGATE COMPACTION:** Excess aggregate deposited in localized areas shall be immediately removed with square-end shovels, and in areas where application is insufficient, additional aggregate shall be added by hand. The treated surface shall be rolled with rubber-tired rollers immediately after the distribution of the cover aggregate, and shall continue until the aggregate is properly seated in the binder. Rollers shall proceed in the longitudinal direction, working across the treated surface until the entire width and length of the treated surface has been rolled at least four times. Rollers and gravel trucks shall not be operated at speeds great enough to kick up chips, and in no case shall rollers be operated above 10 miles per hour. In all places not accessible to the rollers, the aggregate shall be adequately compacted with hand tampers. Any aggregate that becomes coated or mixed with dirt or any other foreign material shall be removed, replaced with clean aggregate over a newly-sprayed surface, and then re-rolled as directed by the City Engineer.
Bituminous material and chips shall not be spread more than 100 feet ahead of completion of initial rolling operations.

To eliminate excessive ridging, all joint edges shall be swept prior to the application of the second course of aggregate on double chip seal treatments.

E. LOOSE AGGREGATE REMOVAL: Upon completion of rolling, traffic will be allowed to use the streets at a speed not to exceed 15 miles per hour for a period of not less than 24 hours. After the chips are set in the bituminous binder, but not earlier than the following day, any loose chips forming corrugations shall be distributed over the surface. At the end of seven days, any excess chips shall be removed in such a manner that the aggregate set in the binder will not be displaced. Excessive rolling or brooming will not be permitted.

F. ASPHALT EMULSION APPLICATION: Asphalt emulsion "Flush Coat" shall then be applied to the finished, chipped surface according to Section 4.3.2.V.

G. MISCELLANEOUS CLEAN UP: After the surface has been opened to traffic, any excess bituminous binder that comes to the surface shall be immediately covered with additional chips or clean sand. The completed surface shall present a uniform appearance and shall be thoroughly compacted and free from ruts, humps, depressions or irregularities due to an uneven distribution of bituminous binder or chips.

H. WEATHER LIMITATIONS: The chip seal shall be placed only when the air temperature in the shade and the road bed temperature are above 75 degrees F. The chip seal shall not be placed when the temperature of the road surface is above 130 degrees F., during rainy weather, when the road is wet or during other unfavorable weather conditions as determined by the City Engineer.

VII. STREET SIGN INSTALLATION METHODS: Street signs shall be installed as follows and placed according to the standard drawings:

A. Posts shall be installed in the post sleeve that is driven plumb into compacted earth. 4\"x4\" pressure treated posts shall be predrilled and compacted into place.

B. All joints shall be cut flat and true.
C. Connections shall be tight.

D. Sign faces shall be cleaned and in the proper orientation.

4.3.3 QUALITY CONTROL: Roadway Construction in City improvements shall have the minimal testing and acceptance standards as follows and conform to the requirements outlined in Section 1.4 of these standards.

I. BASE COURSE QUALITY CONTROL: All base course (both pit run and road base materials) shall be placed in accordance with these standards, and tested and accepted as follows:

A. TESTING: Minimum testing of the base course shall be as follows:

Gradation Tests: One test per 15,000 sq. feet of roadway surface area or fraction thereof. The sieve analysis shall be according to ASTM C136, C117.

Soil Proctor: One determination for each source of base course as necessary to provide required compaction testing. Tests shall be according to ASTM D1557, Method A or D (modified proctor).

Moisture/
Density Tests: One test per 7,000 sq. feet of roadway surface area or fraction thereof. Moisture content shall be at optimum plus or minus 2 percent for test to pass and shall be maintained until prime coat or asphalt is applied. Tests shall be according to ASTM D1556 or D2922 and D3017.

Thickness: One random boring or test hole per 5,000 sq. feet of surface area or fraction thereof to verify required thickness. If sufficient inspection has been made by a City Engineer to verify required thickness, the City Engineer may waive thickness testing.

No single measured thickness shall be less than the required design thickness.
Testing documentation shall be according to Section 2.4 of these standards.

**B. ACCEPTANCE:** Any base course determined not to be in compliance with these standards shall either be removed and replaced or re-worked until compliance is obtained. Any costs for testing re-work shall be paid for by the developer.

**II. BITUMINOUS SURFACE COURSE QUALITY CONTROL:** All bituminous surface course shall be placed in accordance with these standards and tested as follows:

**A. TESTING.** Minimum testing of the bituminous surface course is as follows:

<table>
<thead>
<tr>
<th>Material Certification</th>
<th>Each project shall submit independent written certification through the material supplier that surface course materials comply with these City standards.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>All material certification tests shall be according to ASTM D1559 (modified).</td>
</tr>
<tr>
<td></td>
<td>Certification for a material source previously approved for the current construction season will be acceptable provided sources of the individual components of the combined surface course mix have not changed.</td>
</tr>
</tbody>
</table>

**Extraction-Gradation Test:** One test per 500 tons of material placed or one per day whichever is less. Tests shall be according to UDOT test procedures 8-946 and 8-947.

**Field Density Tests:** One test per 7,000 sq. ft. of surface area or fraction thereof. Tests shall be according to ASTM D2950.

**Thickness Tests:** One core sample from each section of 10,000 sq. ft. or fraction thereof. At the discretion of the City Engineer, thickness testing may be waived for material placed in public roadway construction if sufficient inspection has been made by the City Engineer to verify required thickness.
Testing documentation shall be according to Section 2.4 of these standards.

**B. ACCEPTANCE:** Any bituminous surface course determined not to be in compliance with these standards shall either be removed and replaced or re-worked until compliance is obtained. Any costs for testing re-work shall be paid for by the developer.

**III. BITUMINOUS FLUSH COAT QUALITY CONTROL:** All bituminous flush coat material shall be placed in accordance with these Standards and certified as follows:

**Material Certification:** For each job, the supplier shall submit a report from a certified testing laboratory that the Asphalt Emulsion conforms to these City Standards.

**IV. BITUMINOUS CHIP SEAL QUALITY CONTROL:** All bituminous chip seal materials (CRS-2 and chips) shall be placed in accordance with these Standards and certified as follows:

**Material Certification:** Each job shall submit independent written certification through the material supplier that both the bituminous material and aggregate comply with these City Standards.

**4.4 CONCRETE WORK:** This section of the Standards defines the materials to be used and the requirements for mixing, placing, finishing and curing all Portland cement concrete work on public improvements within Enoch City.

**4.4.1 MATERIALS.** Concrete construction materials in City improvements shall conform to the following requirements:

**I. PORTLAND CEMENT CONCRETE MATERIAL:** The concrete shall be composed of coarse aggregate, fine aggregate, Portland Cement and water, and shall conform to the following requirements:

**A. PORTLAND CEMENT:** ANSI/ASTM C 150, Type I, low alkali, unless otherwise indicated, or acceptable to the City Engineer.

Use Type II or Type V cement for concrete which will be in contact with soil, excluding floor slabs. Use one brand of cement throughout project, unless otherwise acceptable to City Engineer.
B. AGGREGATES. Except as otherwise specified herein, concrete aggregates shall conform to all applicable provisions of the latest revision of ASTM Standard Specification C 33.

1. Fine Aggregate: Fine aggregate shall consist of natural sand or, subject to approval, other inert materials with similar characteristics, having clean, hard, durable, uncoated grains and shall conform to the requirements of these standards. The amount of deleterious substances shall not exceed the following limits:

<table>
<thead>
<tr>
<th>MATERIAL</th>
<th>PERCENT (by weight)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clay Lumps</td>
<td>1.00</td>
</tr>
<tr>
<td>Coal and lignite</td>
<td>0.50</td>
</tr>
<tr>
<td>Material passing No. 200 sieve</td>
<td>3.00</td>
</tr>
<tr>
<td>Other deleterious substances such as shale, alkali, mica, coated grains, soft and flaky particles, etc.</td>
<td>3.00</td>
</tr>
</tbody>
</table>

The sum of the percentage of all deleterious substances shall not exceed five percent by weight.

Fine aggregate shall be well graded and shall range in size from fine to coarse within the following percentages by weight:

<table>
<thead>
<tr>
<th>SIEVE SIZE</th>
<th>PERCENT PASSING (by weight)</th>
</tr>
</thead>
<tbody>
<tr>
<td>3/8 inch</td>

<td>2-5</td>
</tr>
</tbody>
</table>
2. Coarse Aggregate: Coarse aggregate shall consist of crushed stone, gravel, slag or other approved inert material with similar characteristics or combination thereof, having clean, hard, durable, uncoated particles free from deleterious matter. Deleterious substances shall not be present in the aggregate in excess of the following limits:

<table>
<thead>

</tr>
</tbody>
</table>

The sum of the percentages of all deleterious substances in any size or delivered to the mixer, shall not exceed five percent (5%), by weight.

Coarse aggregate may be rejected if it fails to meet the following test requirements:

a. Los Angeles Abrasion Test: If the percent of loss by weight exceeds ten percent at 100 revolutions, or forty percent at 500 revolutions.

b. Sodium Sulfate Test for Soundness: If the weighted average loss after five cycles is more than twelve percent by weight.
c. **Gradation**: Coarse aggregate shall be graded by weight as follows:

<table>
<thead>
<tr>
<th>SIEVE SIZE</th>
<th>PERCENT PASSING (by weight)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 inch</td>
<td>100</td>
</tr>
<tr>
<td>3/4 inch</td>
<td>90-100</td>
</tr>
<tr>
<td>3/8 inch</td>
<td>20-55</td>
</tr>
<tr>
<td>No. 4</td>
<td>0-10</td>
</tr>
<tr>
<td>No. 8</td>
<td>0-5</td>
</tr>
</tbody>
</table>

The maximum size of the aggregate shall be not larger than one-fifth of the narrowest dimension between forms within which the concrete is to be incased, and in no case larger than three-fourths of the minimum clear spacing between reinforcing bars or between reinforcing bars and forms. For un-reinforced concrete slabs, the maximum size of aggregates shall not be larger than one-fourth the slab thickness.

**C. WATER.** Sufficient potable water shall be added to the mix to produce concrete with the minimum practical slump, and in no case shall the slump be greater than 4 inches.

The maximum permissible water-cement ratio (including free moisture in the aggregate) shall be 5 gallons per bag of cement (0.44) for Class A and 5 3/4 gallons per bag of cement (0.51) for Class C concrete.

**D. ENTRAINING AGENT.** An air-entraining agent shall be used in all concrete exposed to the weather. The agent shall conform to ASTM designation C 260. Air content for air-entrained concrete shall be 5% by volume (plus or minus 1%). The air-entraining agent shall be added as a liquid to the mixing water by means of mechanical equipment capable of accurate measurement and control.

**E. ADMIXTURES.**

1. **Pozzolan.** If authorized by the City Engineer, pozzolan conforming to the requirements of ASTM C 618 Class N may be added to the concrete mix with no reduction in cement.
Pozzolans shall be sampled and tested as prescribed in ASTM C 618 and ASTM C 311. The contractor shall obtain and deliver to the City Engineer a certification of compliance signed by the Pozzolan supplier identifying the Pozzolan and stating that the Pozzolan delivered to the batching site complies with applicable specifications.

Pozzolan material shall be handled and stored in the same manner as Portland cement. When facilities for handling bulk Pozzolan are not available, the Pozzolan shall be delivered in original unopened sacks bearing the name and brand of supplier, the type and source of the Pozzolan, and the weight contained in each sack plainly marked thereon.

Different brands or types of pozzolan shall not be mixed together unless written permission has first been obtained from the City Engineer. All Pozzolan used in the manufacture of concrete for any individual structure shall be of the same type, and from the same source unless otherwise approved by the City Engineer.

2. Calcium Chloride. No calcium chloride shall be added to any concrete mix. Non-chloride accelerators may be used with permission of the City Engineer.

E. CONCRETE MIX. For the purpose of practical identification, concrete has been divided into classes. The basic requirements of class A and class C and the use for each is defined in Table 4.10.
**TABLE 4.10**  
**CONCRETE MIX SPECIFICATIONS**

Unless specifically waived by the City Engineer all concrete placed shall be Class "A", six-bag mix, and the minimum allowable compressive strength of concrete at the age of 28 days shall be 4000 p.s.i.  
* For machine placement, sections should not deform.

**II. CONCRETE REINFORCING MATERIALS.** Concrete reinforcing materials shall conform to the following:

**A. STEEL BARS.** All bar material used for reinforcement of concrete shall be intermediate or hard grade steel conforming to the requirements of ASTM Designation A 615 and shall be deformed in accordance with ASTM Designation A 615. All reinforcing steel shall be minimum grade 60 unless approved otherwise by the City Engineer.

All bars shall be deformed round and have a net section equivalent to that of plain bar of equal nominal size. Only intermediate and/or hard grades will be used and no twisted bars will be accepted.
All reinforcing steel, at the time concrete is placed, shall be free from flaws, cracks, mill scale, rust, oil, dirt, paint, (unless epoxy coated) or other coatings that will destroy or reduce the bond.

**B. WIRE OR WIRE MESH REINFORCEMENT.** Welded wire fabric for concrete reinforcement shall conform to the requirements of ASTM A 185. Wire for concrete reinforcement shall conform to the requirements of the "Standard Specification for Cold Drawn Steel Wire for Concrete Reinforcement" ASTM A 82. All wire reinforcement, wire mesh, or expanded metal shall be of the type designated unless an alternate type is approved by the City Engineer.

**C. STEEL FIBER REINFORCEMENT.** Deformed steel fiber for concrete reinforcement shall conform to the requirements of ASTM A 820, type I, deformed fiber, except that the average tensile strength shall be not less than 150,000 psi.

**D. ENGINEERED SYNTHETIC REINFORCING FIBERS.** Engineered synthetic reinforcing fibers shall be 100% polypropylene collated, fibrillated fibers. Fiber length, and amount per manufacturer's recommendations shall correspond with the concrete mixture.

Physical properties of the fibers shall be as follows:

<table>
<thead>
<tr>
<th>Specific Gravity</th>
<th>0.91</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modulus of elasticity</td>
<td>500,000 to 700,000 psi</td>
</tr>
<tr>
<td>Tensile strength</td>
<td>70,000 to 110,000 psi</td>
</tr>
<tr>
<td>Length</td>
<td>0.25 to 2.50 inches</td>
</tr>
</tbody>
</table>

The fiber manufacturer shall certify that all polypropylene fibers meet the physical properties, and are specifically manufactured for use in concrete from virgin polypropylene, containing no reprocessed olefin materials. If the fiber manufacturer is other than the brand name listed on the literature and packaging, the certification must be from the original manufacturer of the fibers.

**III. CONCRETE BASE MATERIALS:** Concrete base materials shall conform to the following:

**A. SUBGRADE:** The subgrade shall be excavated and filled with suitable material as specified in Section 4.1.2 of these standards to within
six inches of the required grades. All soft, yielding and otherwise
unsuitable material shall be removed and replaced with suitable materials
as outlined above. Filled sections shall be compacted and extend to a
minimum of one foot outside the form lines according to Section 4.1.3. III
of these standards.

B. GRAVEL BASE COURSE. A gravel base course consisting of 3/4"
magnitude crushed road base gravel six-inches thick shall be placed under
all driveways, and waterways. Where the foundation material is found to
be unstable, the Contractor shall furnish and place sufficient extra gravel
fill as directed by the City Engineer to firm up the soil upon which the
roadway, driveway or waterway is to be placed.

4.4.2. CONSTRUCTION METHODS & EQUIPMENT: The methods employed in
performing the work, all equipment, tools and machinery, and other appliances used in
handling the materials and executing the work shall be the responsibility of the
Contractor. The Contractor shall make such changes in the methods employed and in the
equipment used as are necessary whenever the concrete being installed does not meet the
specifications herein established. These methods shall include but not be limited to:

I. GENERAL CONCRETE PLACEMENT: Generally concrete shall be installed
as follows:

A. FORMS. Forms shall be substantially built and adequately braced so as
to withstand the liquid weight of concrete. All linings, studding, walling
and bracing shall be such as to prevent bulging, spreading, or loss of true
alignment while pouring and displacement of concrete while setting.

B. PREPARATIONS. Before batching and placing concrete, all
equipment for mixing and transporting the concrete shall be cleaned, all
debris and ice shall be removed from the places to be occupied by the
concrete, forms shall be oiled with a form-release agent, and masonry
filler units that will be in contact with concrete shall be well drenched
with water (except in freezing weather), and the reinforcement shall be
thoroughly cleaned of ice or other coatings. Water shall be removed from
spaces to receive concrete.

When placing concrete on earth surfaces, the surfaces shall be free from
frost, ice, mud and water. When the subgrade is dry soil or pervious
material, it shall be sprayed with water prior to the placing of concrete or
shall be covered with water-proof sheathing paper or a plastic membrane.
No concrete shall be placed until the surfaces have been inspected and
approved by the City Engineer.

4–61
C. CONCRETE MIXING. The concrete shall be mixed until there is a uniform distribution of the materials. Sufficient water shall be used in concrete in which reinforcement is to be imbedded, to produce a mixture which will flow sluggishly when worked and which, at the same time, can be conveyed from the mixer to the forms without separation of the coarse aggregate from the mortar. In no case shall the quantity of water used be sufficient to cause the collection of a surplus in the forms.

Ready-mixed concrete shall be mixed and delivered in accordance with the requirements set forth in Specifications for Ready-Mixed Concrete (ASTM C 94). Concrete shall be delivered and deposited in its final position within 60 minutes after adding the cement and water to the mixture.

D. DEPOSITING. Concrete shall be deposited as nearly as practical in its final position to avoid segregation due to rehandling or flowing. The concrete placing shall be carried on at such a rate that the concrete is at all times plastic and flows readily into the corners of forms and reinforcing bars. No concrete that has partially hardened or been contaminated by foreign material shall be deposited in the work, nor shall re-tempered concrete be used.

All concrete in structures shall be compacted by means of high-frequency internal vibrators of approved type and design during the operation of placing, and shall be thoroughly worked around reinforcement and embedded fixtures and into the corners of the forms. Care must be taken not to over use vibrators causing separation of cement and aggregates.

E. FINISHING. After the concrete for slabs has been brought to the established grade and screeded, it shall be worked with a magnesium float and then given a light "broom" finish. In no case shall dry cement or a mixture of dry cement and sand be sprinkled on the surface to absorb moisture or hasten hardening. Surface edges of all slabs shall be rounded to a radius of 1/4 to 1/2 inch with standard concrete finishing tools.

F. CURING AND PROTECTION. As soon as the concrete has hardened sufficiently to prevent damage, the finished surface shall be kept moist for seven days, or a chemical curing agent may be used to prevent the concrete from premature drying.

The freshly finished surface shall be protected from hot sun and drying winds until it can be sprinkled or covered as above specified. The concrete surface must not be damaged or pitted by rain. The Contractor shall
provide and use, when necessary, sufficient tarpaulins to completely cover all sections that have been placed within the preceding 12 hours. The Contractor shall erect and maintain suitable barriers to protect the finished surface. Any section damaged from traffic, weather or other causes occurring prior to its official acceptance, shall be repaired or replaced by the Contractor in a manner satisfactory to the City Engineer.

G. WEATHER LIMITATIONS: No concrete shall be poured where the air temperature is lower than 35 degrees F. or from the period of November 1 to April 1 of each year unless approved by the City Engineer. When there is likelihood of freezing during the curing period, the concrete shall be protected by means of an insulating covering to prevent freezing of the concrete for a period of not less than seven days after placing. Equipment for protecting the concrete from freezing shall be available at the job site prior to placing concrete. Particular care shall be exercised to protect edges and exposed corners from freezing.

II. CONCRETE REINFORCEMENT INSTALLATION: Concrete reinforcement shall be installed as follows:

A. BENDING. Reinforcing bars shall be accurately formed to the dimensions indicated on the Plans. Bends for stirrups and ties shall be made around a pin having a diameter not less than two times the minimum thickness of the bar. Bends for other bars shall be made around a pin having a diameter not less than six times the minimum thickness of the bar, except that for bars larger than one inch, the pin shall be not less than eight times the minimum thickness of the bar.

B. SPlicing. Splicing of bars at points other than as shown on the Plans will be permitted only by permission of the City Engineer. Splices of reinforcement at points of maximum stress shall be avoided wherever possible, and shall be staggered when used. The minimum overlap for a lapped splice shall be 24 bar diameters, but not less than 12 inches.

C. PLACING. All reinforcing bars shall be placed accurately in the position shown on the Plans, and shall be securely held in position by annealed iron wire ties of not less than 16 gauge or suitable clips at intersection and supported by metal supports, spacers or hangers, in such a manner that there will not be any displacement while placing concrete.
D. EMBEDMENT AND PROTECTION. All reinforcing steel shall be protected by concrete embedment and protective cover as shown in table 4.11, such cover in each case being the shortest distance between the face of the form or concrete surface, and the nearest edge or face of the reinforcement.

</tr>
</tbody>
</table>

E. FIBERMESH INSTALLATION. Fiber-mesh shall be added, according to the manufacturer’s recommendations, only at the concrete batch plant to assure uniform and complete dispersion of the collated-fibrillated fiber bundles into single mono-filaments within the concrete.

III. CONCRETE PLACEMENT. Concrete shall be placed by the formed method.

A. FORMED METHOD. The forms shall be of wood, metal, or other suitable material that is straight and free from warp, having sufficient strength to resist the pressure of the concrete without displacement and sufficient tightness to prevent the leakage of mortar. Flexible or rigid forms of proper curvature may be used for curves having a radius of 100 ft. or less. Division plates shall be metal.

The front and back forms shall extend for the full depth of the concrete. All forms shall be braced and staked so that they remain in both horizontal and vertical alignment until their removal. They shall be cleaned and coated with an approved form-release agent before concrete is placed against them.
The concrete shall be deposited into the forms without segregation and then tamped and spaded or mechanically vibrated for thorough consolidation. Front and back forms shall be removed without damage to the concrete after it has set.

**B. FINISHING.** The plastic concrete shall be finished smooth, if necessary, by means of a wood or magnesium float and then given a final surface texture using a light broom or burlap drag. Concrete that is adjacent to forms and formed joints shall be edged with a standard jointer or edging tool to the dimensions shown on the plans. The top, face, and flow-line of the waterway and also the top of the apron on driveway aprons shall be finished true to line and grade and without any irregularities of surface noticeable to the eye.

The waterway shall not pond water when tested by water flow and no portion of the surface of the waterway shall depart more than one-fourth of an inch from a straight edge, ten feet in length, placed on the waterway parallel to the center line of the street, nor shall any part of the exposed surface present a wavy appearance.

**C. PROTECTION.** At all times during the construction of the project, the Contractor shall have materials available at the site to protect the surface of the plastic concrete against rain. These materials shall consist of waterproof paper or plastic sheeting.

**D. CURING.** Concrete shall be cured for at least three days after placement to protect it against loss of moisture, rapid temperature change, and mechanical injury. Moist burlap, waterproof paper, polyethylene sheeting, liquid membrane curing compound, or a combination thereof may be used as the curing material. Membrane curing shall not be permitted in frost-affected areas when the concrete will be exposed to deicing chemicals within 30 days after completion of the curing period.

**E. BACKFILLING.** After at least three days after placement and the forms have been removed from the concrete, the Contractor shall backfill to the line and elevation as shown on the drawings or as required by the City Engineer.

**F. CONCRETE REPAIR:** In lieu of removing and replacing concrete with minor cracks, the City Engineer may direct the Contractor to repair the affected sections by sawing, cleaning and sealing the cracks. All cracks repaired shall be sealed with a polyurethane TTS-230 type II crack filler, or an approved silicone type crack filler. Where modifications are
to be made to existing concrete, the edges to be poured against shall be sawed and the new concrete shall be edged with a standard edging tool.

G. WEATHER LIMITATIONS: No concrete shall be poured where the air temperature is lower than 35 degrees F. or from the period of November 1 to April 1 of each year unless approved by the City Engineer. When there is likelihood of freezing during the curing period, the concrete shall be protected by means of an insulating covering to prevent freezing of the concrete for a period of not less than seven days after placing. Equipment for protecting the concrete from freezing shall be available at the job site prior to placing concrete. Particular care shall be exercised to protect edges and exposed corners from freezing.

IV. CONCRETE BASE MATERIALS PLACEMENT: The placement of concrete base materials (pit run and road base) under all concrete structures shall conform to Sections 4.3.2.I and 4.3.2.II of these standards.

4.4.3. QUALITY CONTROL. All concrete and base materials shall be placed in accordance with these standards and tested as follows:

I. CONCRETE TESTING. Minimum testing of the concrete shall be as follows:

Mix Design Certification: One per job. Testing shall be according to the latest ASTM standards.

Compressive Strength Tests: One set of (3) cylinders for each 50 cubic yards of concrete placed. Tests shall be according to ASTM C39.

Air Entrainment: Tested at beginning of load placement until two consecutive tests pass. Others shall be taken as required. Tests shall be according to ASTM C231.

Slump Tests: Tested at beginning of load placement until two consecutive tests pass. Others shall be taken as required. Tests shall be according to ASTM C143.

II. CONCRETE BASE MATERIAL TESTING. Minimum testing of all base material (both pit run and road base materials) shall be tested as follows:
Gradation Tests: One test per 10000 square feet or fraction thereof.

The sieve analysis shall be according to ASTM C136, C117.

Soil Proctor: One determination of each source of base course as necessary to provide required compaction testing. Test shall be according to ASTM D1557, Method A or D (modified proctor).

Moisture Density Tests: One test per 10000 square feet or fraction thereof on each lift. Moisture content shall be at plus or minus 2 percent for tests to pass and shall be maintained until the concrete is poured. Tests shall be according to ASTM D1556 or D2922 and D3017.

Thickness: One random boring or test hole per 10000 square feet or fraction thereof. If sufficient inspection has been made by a City Engineer to verify required thickness, the City Engineer may waive thickness testing.

No single measured thickness shall be less than the required thickness.

Testing documentation shall be according to Section 1.4 of these standards.

III. ACCEPTANCE. The average of any three consecutive strength breaks shall equal or exceed the minimum 28-day compressive strength. If the average of any three consecutive breaks is below specification, the concrete may be rejected unless retests prove otherwise.

Concrete with a compressive strength below the required strength shall be evaluated by the City Engineer for capabilities necessary to the integrity of the structure. The City Engineer may accept this concrete under a special guarantee from the deliverer, or require that it be replaced with acceptable material. The City Engineer shall make the final decision. If additional tests are required to determine if strength tests are representative they shall be performed by coring in accordance with ASTM C 42 method or other acceptable non-destructive methods. The re-tested strength shall be the average of three cores (or other means). All costs incurred in re-sampling and retesting shall be paid by the developer.
Any concrete base material determined not to be in compliance with these standards shall either be removed and replaced or re-worked until compliance is obtained. Any costs for testing re-work shall be paid for by the developer.
